

5-	1	SCHED -- Suspend job and look for another
8-	1	SWPCHK -- See if job swapping is needed
9-	1	GETMEM -- Try to get free memory for a job
10-	1	TRYMEM -- Try to allocate memory space for a job
11-	1	FREMEM -- Free a memory region
12-	1	TRYPLS -- Determine # memory pages available for PLAS
13-	1	TRYRGN -- Try to allocate memory for global region
14-	1	SETMAP -- Set up memory mapping registers for a job
15-	1	LODMAP -- Load memory mapping from context block
16-	1	MAPSYS -- Map to the system code regions
17-	1	PKSTAT -- Pack user status into context block
18-	1	UPSTAT -- Unpack user status from context block
19-	1	DOCMPL -- Call job's completion routines
20-	1	SUTOP -- Set top of memory for a job
21-	1	MEMXPN -- Do job swap to expand memory size
22-	1	CXBMOV -- Move job context data into buffer
23-	1	ENQHD -- Put user at head of queue
24-	1	ENQTL -- Add user to tail of execution queue
25-	1	DEQ -- Remove user from run queue
26-	1	QSRCH -- Look for 1st user with some execution state
27-	1	QNSPND -- Put job in wait state
28-	2	FORCEX -- Force user execution
28-	23	CHKABT -- Check for abort condition
29-	1	UREGO -- Restart user at head of wait queue
30-	1	QHIPRI -- Put user in high priority queue
31-	1	QCPU -- Place job in CPU-bound run queue
32-	1	GTSYMB -- Get system message buffer
33-	1	TSXTRP -- Catch traps
34-	1	TRPMAP -- High-performance memory mapping service
35-	1	UEXINT -- Unexpected interrupt
37-	1	CLKINT -- Clock interrupt routine
38-	1	ENSYS -- Enter system state
39-	1	INTEN -- Interrupt entry processing
42-	1	FORK -- Queue a fork request
43-	1	FRKGET -- Get a free Fork block
44-	1	FORKQ -- Queue a fork request
45-	1	SYNCH -- Queue a sync request
46-	1	QUNSIG -- Signal quantum expiration
47-	1	SYSHLT -- Fatal system halt
48-	1	INIJMP -- Final system initialization

```

7
8 ;   TSEEXEC is the executive control module of TSX-Plus.
9 ;   It contains routines to perform job scheduling, memory management,
10 ;   clock interrupt processing, etc.

1 .SBTTL SETMAP -- Set up memory mapping registers for a job
2 ;
3 ; SETMAP is called to load the memory mapping registers for a job.
4 ; The user mode registers are set to point to the user program space.
5 ;
6 ; Inputs
7 ; R1 = Job index number.
8 ; LNBLKS = # 256-word blocks assigned to job.
9 ; LPARBS = Physical address (32-word block #) of job's virtual address 0.
10 ;
11 ; Outputs:
12 ; User-mode PAR and PDR registers are loaded.
13 ; Mapping information is stored in CUPAR and CUPDR cells in job's
14 ; context block.
15 ;

1 .SBTTL QSRCH -- Look for 1st user with some execution state
2 ;
3 ; QSRCH is called to locate the highest priority user in a
4 ; certain execution state.
5 ; When called, R0 must contain the execution state code ($-----).
6 ; If a user is found with the state code, the user index number
7 ; is returned in R1 and the C-flag is cleared.
8 ; If no user is found with the specified state, the C-flag is
9 ; set on return.
10 ; ** Interrupts are disabled and left disabled if a user is found
11 ; with the specified state. If no user is found, the interrupts
12 ; are reenabled before returning. **
13 ; All registers are preserved except R1.

1           .SBTTL QNSPND -- Put job in wait state
2
3           ; There are four routines that can be called to suspend the
4           ; execution of a job: QNSPND, QNSPNX, QHDSPN, QHDSPX.
5           ; All four routines perform the functions of changing the
6           ; job state to a specified wait state and then calling the
7           ; job scheduler to run some other job while the current job is waiting.
8           ; Before placing the job in the specified wait state, these routines
9           ; check to see if there is a pending completion routine for the job.
10          ; If there is a pending completion routine, the job state is changed
11          ; to the state associated with the completion routine to allow the
12          ; completion routine to run before the job is suspended.
13          ; The difference between the four routines is whether the job is
14          ; queued at the head or tail of the wait queue and whether the
15          ; job's time-slice quantum is reset.
16
17          ; QNSPND -- Queue at tail of wait list, reset quantum.
18          ; QNSPNX -- Queue at tail of wait list, don't reset quantum.
19          ; QHDSPN -- Queue at head of wait list, reset quantum.
20          ; QHDSPX -- Queue at head of wait list, don't reset quantum.
21
22          ; Inputs:
23          ; R0 = Job state to which job is to be set before calling scheduler.
24
25          ; Outputs:
26          ; Interrupts are enabled.
27
28          ; Queue at tail of wait list, reset quantum.

60 ; -----  
61 ; QCKCPL is a local subroutine called by the queue-and-suspend  
62 ; routines to perform common setup functions.  
63 ; The following operations are performed.  
64 ; 1) Interrupts are disabled.  
65 ; 2) The current job number is loaded into R1.  
66 ; 3) If there is a pending completion routine, the priority request  
67 ;     for the job is changed to the priority of the completion routine.  
68 ;
69 ; Inputs:  
70 ;     R0 = Requested wait state for job to be placed in.  
71 ;
72 ; Outputs:  
73 ;     R0 = Job state that job is actually to be put in.  
74 ;     R1 = Current job index number.  
75 ;     Interrupts are left disabled.

1 .SBTTL INTEN -- Interrupt entry processing
2 ;
3 ; INTEN performs the RT-11 .INTEN function which is used to begin
4 ; interrupt processing. The form of the call to INTEN is:
5 ;
6 ; JSR R5,INTEN
7 ; .WORD <^CPriority to run at>&340
8 ;
9 ; INTEN switches to the TSX interrupt stack and then calls the calling
10 ; routine back as a coroutine.
11 ; When the interrupt processing task completes, it exits back to
12 ; INTEN by doing an RTS PC.
13 ; Before returning from interrupt processing INTEN calls any routines
14 ; queued as a result of .FORK requests and also may call the job scheduler
15 ; if any job scheduling event occurred during interrupt processing.
16 ;
17 ; There are three "level indicators" that indicate the processing state.
18 ; INTLVL indicates the hardware interrupt level.
19 ; STKLVL indicates if we are running on the interrupt stack.
20 ; FRKPRI indicates the current fork processing priority.
21 ; The initial (non-interrupt, non-fork) value for all three is -1.
22 ; If INTLVL >= 0 we are in an interrupt routine.
23 ; If INTLVL < 0 we are not at interrupt level but may be at fork level.
24 ; If FRKPRI > 0 we are at fork level.
25 ;
26 006404 010446
27 ; INTEN: MOV R4,-(SP) ;R5 is already on stack, save R4 too.

FORK -- Queue a fork request

```

1           .SBTTL FORK    -- Queue a fork request
2
3           ;-----;
4           ; FORK is called to queue a fork request.
5           ; Note that INTEN must have been called before FORK is called and that
6           ; nothing may be pushed on the stack between the INTEN call and the FORK.
7           ; A fork request is held until the last active interrupt routine is ready
8           ; to return to the job that was originally interrupted then the fork
9           ; requests are processed in order by priority and, within the same priority,
10          ; by the order in which they were queued.
11          ; The form of the call to FORK is:
12
13          ;      JSR      R5,FORK
14          ;      .WORD    <forkblock-> or <priority>
15
16          ; The TSX fork routine differs from the RT-11 fork routine in that TSX
17          ; uses an internal set of fork request blocks rather than using blocks
18          ; provided by the caller of FORK.
19          ; The word following the JSR R5,FORK may contain the address of a user
20          ; fork block, or it may contain a priority value in the range 1 to 127
21          ; which becomes the fork processing priority, or it may be zero (0) in which
22          ; case a default fork priority (FP$DEF) is used.
