1          .TITLE  TSOVR - Overlay handler for mapped system regions
2
3          ;
4          ; This overlay handler replaces the normal RT11 handler in SYSLIB at link
5          ; time.  The calling sequence remains the same as documented in the RT-11
6          ; System User's Guide chapter 11.  This handler is called by a dummy
7          ; subroutine of the following form:
8          ;
9          ;       JSR      R5,$OVRH      ;call to common code for overlays
10         ;       .WORD   <OVERLAY # * 6> ;# of desired segment
11         ;       .WORD   <ENTRY ADDRESS> ;actual core address (virtual)
12         ;
13         ; This routine intercepts the overlay request and maps KPAR5 to the
14         ; address in physical memory where the segment was loaded.
15         ;

27 000000  010546      MOV      R5,-(SP)      ;save a pointer to the argument list
28 000002  011505      MOV      (R5),R5      ;obtain the segment number of the system region
29 000004  004767  0000000  CALL     MAPSYS      ;call the mapping system routine
30 000010  012605      MOV      (SP)+,R5     ;restore the pointer to the argument list
31 000012  005725      TST      (R5)+      ;get to the module entry point
32 000014  011505      MOV      @R5,R5      ;obtain entry of address of mapped module
33 000016  000205      RTS      R5         ;enter the system mapped region
34         000020      OVRLEN = . - $OVRH   ;length of the overlay handler
35         ;
36         ; OVRHC is used by the root and mapped regions to call other mapped
37         ; regions.  It preserves the currently mapped region, sets a return address,
38         ; and calls the system overlay handler.  Upon return, it restores the
39         ; previously mapped region and returns to the caller.
40         ;
41 000020  011646      OVRHC:  MOV      (SP),-(SP)    ;move the return address down one location
42 000022  013746  0000000  MOV      @#KPAR5,-(SP) ;save the system mapping region on the stack
43 000026  012746  000046'  MOV      #OVRET,-(SP)  ;save the return address on the stack
44 000032  017646  000004   MOV      @4(SP),-(SP)  ;obtain the entry address
45 000036  062766  000002  000006  ADD      #2,6(SP)      ;set return past the module overlay address
46 000044  000136      JMP      @(SP)+      ;jump into the overlay handler
47         ;
48         ; OVRET will return from the DCALL macro.
49         ; The C-bit must be preserved on entry until the return.
50         ;
51 000046  013766  0000000  000004  OVRET:  MOV      @#PSW,4(SP) ;save the current psw
52 000054  012637  0000000  MOV      (SP)+,@#KPAR5 ;restore system overlay mapping
53 000060  000002      RTI      ;return to the caller
54
55 000062  000000'  OVRADD:  .WORD   $OVTAB      ;point to overlay handler table
56         ;
57         ; Overlay table structure:

```

```
58 ;
59 ; loc 64 --> $DVTAB:
60 ; .WORD <IDENTIFIER>, <KPAR5>, <WORD COUNT>
61 ; DUMMY SUBROUTINES FOR ALL OVERLAY SEGMENTS
62 ;
63 000000 .PSECT $OTABL, D, QBL, QVR
64
65 000000 $DVTAB:
66
67 000001 .END
```
