REVISIONS

REV	DESCRIPTION	CHG NO	ORIG	DATE	APPD BY	DATE
A		PC04-00046	M. LEIS		[redacted]	3-17-71

General Information:

The PC⌀4 comes in eight (8) configurations. They are the PC⌀4P, PL (basic punch), PC⌀4R, RB (basic reader), PC⌀4B, BB, BL, (punch and reader), and PC⌀4C (punch, SCR, and reader). The 50 cycle variations are PC⌀4PA, PM; PC⌀4BA, BC, [illegible], and PC⌀4CA with no variation in PC⌀4R and RB. Table 1-1 gives the block schematic references, UML, interface cables, and the applicable computers.

Logic Levels: Negative Logic Systems
Logic 1 is -3.2v to -3.9 volts
Logic 0 is 0v to -0.3 volts

Logic Levels: Positive Logic Systems

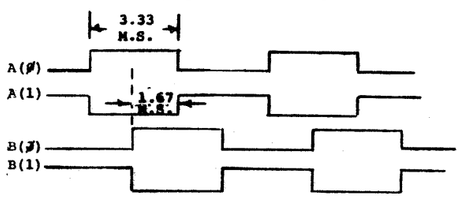
	Outputs	Inputs
Logic 1 is	>+2.4v	>+2.0v
Logic 0	<+0.4v	<+0.8v

Reader Signals:

Reference drawing BS-D-PC⌀4-0-2

(1) A(0), A(1), B(0), and B(1) are the signals used to drive the stepping motors via the four solenoid drivers.

The timing chart and graph for these signals would be:



ENG	APPD	SIZE	CODE	NUMBER	REV

TITLE PC⌀4 Engineering Specification

(2) Power (1) serves the function of supplying only half current to the stepping motor when the motor is stopped. This signal is 0 volts when the motor is stopped and -3 volts when the motor is active for negative logic systems and >+2.0 volts when motor is active and <+0.8 v when the motor is stopped for positive logic systems.

(3) The reader feed switch is simply an off line means of moving tape through the reader. A ground level performs this function.

(4) The reader on/off line switch allows the operator to disable the unit from reading by putting the switch in the off-line position.

(5) The reader on/off line switch is open whenever the reader is off line, and is >2.4V when the reader is on line.

(6) Data Output Lines:

	Hole	No Hole
Negative Systems	-3 volts	⌀ volts
Positive Systems	+2.4 volts	0 volts

Punch Signals:

Refer to drawing BS-D-PC⌀4-0-2

(1) The interface signal used to turn on the punch motor with an SCR driver option is Gnd when active and open or -3v when inactive.

(2) The -36 volt is supplied to the solenoid coils on the punch motor and also to the solenoid drivers at the external control.

(3) Punch sync is the signal generated from the sync timing wheel on the punch. Equally spaced (in time) positive and negative pulses (one each) for each shaft revolution is generated on this line.

(4) Forward tape and punch feed hole: A ground level for 10 msec. ±10% will punch feed hole and then advance the tape forward in preparation for another cycle for all configurations except PC⌀4PL and BL when the solenoid drivers are activated by a >+2.0v signal.

SHEET 2 OF 7

TITLE PC04 Engineering Specification

(5) The eight data holes also require a 10 msec. level to activate the punches.

(6) Out-of-tape signal is generated from a micro-switch on the punch. It is at ground when the punch is out-of-tape.

(7) Punch feed switch is used to manually feed tape through the punch.

(8) The -3 volt or +5v supply is a bias on the punch sync coil.

(9) The punch on/off power switch is used in the options not using the SCR driver. It simply supplies 115 volts to the punch motor.

Power Supply

(1) Regulated +5 volts ±.25 volts

(2) Regulated -15 volts ±1.0 volt

TITLE PC8-E READER PUNCH CONTROL

1. Overall Description

The PC8-E is the reader/punch control for the PDP-8/E computer. The PC8/E is designed to control the reader/punch type PC04.

2. General Specification

2.1 The interface, entirely TTL, is designed around the constraints of the PDP-8/E bus. All connections to the reader/punch is via shielded flex-print connected to edge-type connectors.

2.2 Punch Done Timing may be either 4.5 milliseconds or 10 milliseconds, jumper selectable on the board. Reader timing may be slowed by removing two jumpers, for use with the PR8-ES Reader.

2.3 The entire interface is contained on one 8½" by 11" quad board.

2.4 The temperature limits are 32F to 120F and relative humidity 10% to 90%, non-condensing. The power requirements are:

+ 5 volts at 1.25 amps.
-15 volts at 75 milliamps.

2.5 The control is completely compatable with all software that is PC8/L oriented.

3. Specification of Vendor-Supplied Equipment

3.1 See applicable purchase specification for board components.

4. Programming

4.1 Reader IOT's

RPE	6010	Set interrupt enable for reader and punch
RSF	6011	Skip if reader flag = 1
RRB	6012	Read reader buffer, clr flag
RFC	6014	Clr flag , fetch character
	6016	Same as 12 and 14

NOTE: Initialize sets program Interrupt Enable Flag

PSF	6021	Skip if Punch Flag = 1
PCF	6022	Clr Flag
PPC	6024	Load Buffer & Punch Character
PLS	6026	Clr Flag, Load & Punch

4.2 There are no maintenance instructions.

4.3 Data format is parallel for both reader and punch. For the reader 8 bits are loaded from photo-cell into the reader buffer then onto the Data Bus. Then at the appropriate time the data is strobed into AC bits 4 thru 11. AC 11 being the least significant bit. The punch buffer is loaded from Data Bus bits 4 thru 11 then the contents of the punch buffer select or de-select solenoid drivers which punch the data.

4.4 There are no timing diagrams.

4.5 There are no operator controls except for one potentiometer that sets the clock circuit for a reader speed of 300 char/sec. This control is used during initial reader adjustment.

5. Interface Specifications

5.1 All bus signals conform to the bus rules of the PDP-8/E. All signals between the reader and punch appear on pins of the 2 connectors that are pin compatible with the PC8/L.

5.2 The following is a list of reader, punch variations for the 8/E.
