

MAINDEC 08-D03A-D

IDENTIFICATION

Product Code: MAINDEC 08-D03A-D

Product Name: Basic JMP-JMS Test

Date Created: April 1, 1967

Maintainer: Diagnostics Group

Author: R. Green

1. ABSTRACT

This is a diagnostic program for testing the JMP and JMS instructions of the PDP-8.

2. REQUIREMENTS

2.1 Equipment

A PDP-8 equipped with Teletype.

2.2 Storage

This program uses all memory. The Binary Loader must be stored in the last memory page.

2.3 Preliminary Programs

MAINDEC 08-D01(n) and MAINDEC 08-D02(n).

3. LOADING PROCEDURE

3.1 Method

The standard Binary Loader is used. There are actually two programs on the binary tape. The loading sequence is as follows:

- a. Place 7777 in the SR (SWITCH REGISTER); press LOAD ADDRESS.
- b. Start the Binary Loader. The program loads from the paper tape reader. When the first program on the tape is loaded, the loader program halts.
- c. Place 0002 in the SWITCH REGISTER; press LOAD ADDRESS. Set SR to the Binary Loader starting configuration (7777 or 3777), then push START. HLT orders are deposited throughout all unused core; then control is returned to the Binary Loader and the diagnostic program is loaded.

4. STARTING PROCEDURE

4.1 Control Switch Settings

(None)

4.2 Starting Address

600

4.3 Restart Address

4200

4.4 Operator Action

- a. Set SR to 600 and press LOAD ADDRESS.
- b. Push START. The program will store parts of the RIM and Binary Loaders that will be destroyed.
- c. The program halts, the loader is stored (program counter = 632).
- d. Push CONTINUE. Program jumps to 4200 and testing begins.

5. OPERATING PROCEDURES

5.1 Program Restarts

Since the loaders are already stored, a program restart should begin at 4200, not 600.

5.2 Program End

To restore the loaders at the conclusion of the test, start at 700. When the program halts, restoration is completed (PC=732).

6. ERRORS

6.1 Error Halts and Description

See listing, section 10.

6.2 Error Recovery

In most cases it is possible to insert a JMP instruction in the error halt position to return the program to the failing test. This forms a program loop on the failing test and allows the problem to be investigated with an oscilloscope. In most cases where a scope mode loop cannot be maintained due to the instability of the JMP or JMS instruction and its failing condition, it will probably be advantageous to simulate this same problem using Random JMP Test, MAINDEC 08-D04(n), or Random JMS Test, MAINDEC 08-D05(n).

7. RESTRICTIONS

(None)

8. MISCELLANEOUS

8.1 Execution Time

315 complete program loops per second.

9. PROGRAM DESCRIPTION

The program is made up of 82 individual tests for JMP and JMS. An octal counter located at memory location 0136 always holds the number of the present test. For test 1, location 0136 contains 0000 and for test 82, 0136 contains 0121. Each test performs the following functions:

- a. Checks location 0136 for proper test number.
- b. Performs additional checking such as verification of the stored PC (program counter) on a JMS.
- c. Advances test counter.
- d. Sets up for next test.
- e. JMPs or JMSs to the next test. These JMP and JMS instructions are the ones being tested.

If the PC does not arrive at the proper place after performing the steps above, it either falls into the background field of HLTS or into another area of the program. If the field of HLTS is encountered, the program halts immediately. If a program field is entered, it is most likely that the program will halt when the test counter check is made (location 136 equals the test count). In a few remote cases it is possible for the test counter to be advanced by one, following the erroneous JMP or JMS and before the halt. It is also possible for the program, on an error condition, to enter the loaders stored in the last memory page. All of these possibilities should be kept in mind when analyzing an error.

Tests 0 through 19 are tests for same page jumping using direct addressing. Tests 20 through 45 test the JMP instruction with indirect addressing. In these cases the address that the program jumps to is always the complement of its present address. Tests 46 through 57 are JMS tests for the same page using direct addressing. Tests 58 through 81 test JMS in the same manner as JMP is tested in test 20 through 45.

An "03" is printed after every 4096 program loops.
