

July 7, 1970

TO: PDP-10 Customers

FROM: David Stone
Supervisor - PDP-10 Monitor Development

SUBJECT: The 5.01 Monitor for the PDP-10

This document explains the contents of the software kit accompanying the release of 5.01. Read it first to guide you to an understanding of the rest of the material.

Sincerely,

David L. Stone

1.4 A list of Level C only monitor routines replaced by Level D routines:

DPCINT
DPCREF
DSKSER
FHDINT
FHDREF
MDFINT
MDFREF
SCHED (now two routines; SCHED1 and SWPSER)

2. A GUIDE TO THE 5.01 DOCUMENTATION

2.1 Existing Documentation.

Except in the area of the disk service, the 5.01 monitor conforms to the same documentation as the previous release (4S72) as modified by the published Monitor Change Orders (MCO's). The definitive document is the PDP-10 Software Notebook which is updated at least quarterly. Other documents which pertain are the PDP-10 Reference Handbook and the newly published PDP-10 Timesharing Handbook. These are modified by the MCO's which are included in this release.

2.2 New Documentation.

2.2.1 Level D.MEM

This memorandum is the best introduction to the new Level D disk service. It is divided into four sections -- each explaining the disk service from a different point of view. The operator,

the console user, the programmer and the system manager are all given an introduction to the details which are more fully described in DSKØ16.MEM.

2.2.2 DSKØ16.MEM

DSKØ16.MEM is the definitive detailed description of the Level D disk service. It should be read by all systems programmers and system managers. Since it is an older document, some changes have occurred. These are described in LEVELD.MEM.

2.2.3 MONITR.OPR

This document contains complete instructions for building and operating the 5.01 monitor. It is extremely valuable to system operators and managers.

2.2.4 TABLE.TXT

TABLE.TXT is a table of contents for the magnetic tape which contains the 5.01 release. It divides the release into sections which correspond to the DEC-tapes on which they are kept at Maynard. Each module is briefly identified by a line of text.

2.2.5 MONSUP.MAN

This document is a supplement to the other documentation and contains information about 5.01 which is not directly related to the disk file system -- e.g. the DC10E handler and the TMPCOR feature.

2.2.6 DOC'S, MEM'S and MAN'S.

On the release tape are many files with extension DOC, MEM and MAN. These files are the original documentation for the monitor support cusps supplied on the tape. In section .1.3 of this letter, references to "tape 10" mean that the cusp in question (say FILEX) is documented by an ascii file named FILEX.MEM to be found in the DEC-tape 10 section of the release.

2.2.7 FLO'S.

The three files in the release with extension FLO are "english flow-charts" of the internal workings of three major portions of the Level D disk service. They are intended to give insight into the algorithms used by the programs but are not at this time completely accurate. However, as a guide to the system programmer they are still valuable, though not as definitive as the listings.

2.2.8 PATCHES

Fixes to the monitor made after 5.01 was frozen are documented in the patch release included in the software kit.

3. A FEW WORDS ABOUT THE LEVEL D DISK SERVICE

The Level D Disk Service included in the 5.01 release is extremely complex and very efficient. It has a large number of options and parameters which can be used to tailor it to a specific configuration. However, since there are so many hardware and software options, it is inevitable that some combinations are never tested together. The standard answers for the once-once dialogue are given in LevelD.MEM. The answers given there have all been tested. Hardware configurations tested have included RM10B drums, RD10 fixed head disks, RP01 disk packs (up to 4) and RP02 disk packs (up to 3). Dual RP10 controllers have been used to drive both RP01 and RP02 disks simultaneously. Both file and swapping storage have been put on all of the above devices, singly and in combination. In short, we have tested a large number of options but have left some out.

As a result of the complexity of the options available, Software Trouble Reports for the disk service will have to include a great deal of pertinent information in order to be serviced. Anomalies of hardware configuration, file structures and software parameters will have to be spelled out explicitly where pertinent.

4. 5.01 RELIABILITY

The 5.01 monitor has been running in some form at Maynard on our development PDP-10 since March of 1970. We have subjected

the monitor to two kinds of stringent testing in addition to the usual unit and integrated tests made for any project. First, we have created a program to generate jobs which perform actions according to directions in an ascii file (for details see SCRIPT.MEM on Tape 12). Using this program to generate job loads as high as 64 users (on an 80K configuration) we have exhaustively tested the various areas which typically cause trouble with monitors -- limit conditions especially. We have scripts which fill up and fragment the swapping space, load the IO channels, exhaust the available disk space, etc. These scripts, when run simultaneously, cause the monitor algorithms considerable anguish. However, the 5.01 monitor has been taught to live comfortably with them.

Another application of the SCRIPT program has been to generate job loads which closely approximate the user job loads which we see in-house on our production machine and on other machines run by our customers. These scripts, which use all the standard language processors and cusps, also run the line printer and tape drives to simulate an actual user environment. They have been very helpful in debugging the 5.01 release.

Most important of our reliability tools, however, has been our production time-sharing PDP-10. This machine has a user population which typically varies from 28 to 36 during prime shift (8:30 a.m. to 6:00 p.m.), from 15 to 20 during the second shift (6:00 p.m. to 12:00 p.m.) and from 0 to 10 during weekends. These three different intensities of use give us a good evaluation of the reliability of our monitor under different loads. The configuration of the machine is 80K of 1.8 μ s memory, one RM10B for swapping on its own DF-10, 3 RP02 disk drives on another DF-10, 3 magnetic tape drives, 8 DECTape drives and a line printer. It handles up to 40 simultaneous users -- primarily on hardwired TTY's but with up to eight remote TTY's. The reasonable response job limit for this configuration is about 30-34 jobs. Most of the users are systems programmers and therefore are capable of putting more strain on the system than most users.

During most of the month of June, precursors to 5.01 have been running on the production machine. Reliability has proven to be roughly linear with load. During the two weeks preceeding the writing of this letter, the crash rate on that machine has been:

	Week 1	Week 2
1st. shift	1 crash/shift	NO CRASHES
2nd. shift	1/2 crash/shift	
Weekends	No Crashes	

During this period, the number of users who can be accommodated with reasonable response has increased over Level C by about 5 - or roughly 20%.

5. EFFICIENCY AND THROUGHPUT MEASUREMENT

5.1 WATCH.

A new feature has been added to the 5.01 monitor to allow the user to observe the service he is getting and the efficiency of his programs. The WATCH command allows each user to have a printout of the time of day at the beginning of each command which uses user core and at the end, a printout of the elapsed real time and cpu time, plus the number of disk reads and writes (in blocks) for his program. Any or all of these printouts may be requested. Once turned on, they continue until another Watch command is given. The default printouts are set table at assembly time and patchable. The monitor is distributed with the default set to no printout. Type WATCH H for a list of the parameter names. See MCO's for a detailed description.

5.2 Level D versus Level C.

Some measurement of the efficiency of Level D versus Level C has been made. While any such tests are bound by a large number of parameters (exact placement on the disk, buffer size, competition from other users), a few general comments apply.

For a sequentially accessed file stored in contiguous blocks on a disk pack, Level C will require a full latency between adjacent blocks if they are requested by two separate input UUO's. Since Level C allows no parallel operations on other disks, the entire system is slowed down by the loss of latency. The maximum throughput for a single block requested at a time (assuming the drive to be always on track) is one block per 27.5 milliseconds. Level D, on the other hand, will not miss the latency if the input request is made in time.

The more disk drives, controllers and channels you have, the more efficient Level D will be over Level C because of parallel seeks and data transfers. With four RP02's on one controller and one channel, if a random track request for a single block is always queued up for each drive, the Level C throughput is one block every 65 ms

or 15.4 blocks per second. The Level D throughput is one block every 15 ms or 67 blocks per second.

On a user benchmark involving a loop of fortran overlays, Level D took less than one-third the real time required by Level C on the same equipment. More comprehensive measurements of Level D's efficiency are under way and will be reported later.

6. SOME NEW PROGRAMS

6.1 Crash Procedures.

To speed up the operation of a computer, the 5.01 release contains two new support cusps which facilitate loading a new monitor, dumping a dead monitor and dealing with the dump; they are BOOTS and FILEX. Both these programs have their own documentation files on DEctape image 10. BOOTS should be kept on a paper tape for loading into the machine after a crash. It will save the remains in "CRASH.SAV" and reload the system from "SYSTEM.SAV". FILEX will expand the CRASH.SAV file into input suitable for FILDDT to analyze.

6.2 SCRIPT and SCP's.

Included in the 5.01 release are the SCRIPT program (mentioned above) and a number of files with extension SCP. These latter are the ascii input to SCRIPT and consist of several of our test programs. We have included them as potentially helpful examples of SCRIPT input.

6.3 FRM's.

Files with extension FRM are examples of the forms which we use at Maynard to report software errors and fixes. They are included because some of our customers indicated that they would be useful.

6.4 DSKC and Friends.

The files DSKC, DSKC0, DSKC1 and DSKC2 are simple DDT programs to print the number of free blocks remaining on a file structure. They are interim programs to help out until the "LEFT" command is implemented. DSKC prints out the total number of blocks left on logical structure DSKC. Similarly, DSKC0 -1 and -2 print the number of

free blocks left on units 0, 1 and 2 of logical structure DSKC. By suitable use of the ASSIGN command (.ASSIGN DSKB DSKC) any file structure can be investigated.

6.5 Others.

For descriptions of other new programs see section 1.3 of this letter for the place in which they are documented.

7. DOCUMENTATION CHANGES

7.1 Protection.

The 5.01 file protection scheme is almost completely compatible with Level C. The correct description is given in Level D.MEM Version 2 dated May 27, 1970 on page 27. DSK016.MEM has an incorrect description. The default protection has been set to 057 rather than 055 at the request of our service bureau customers. This means that files in one project cannot be read by another project. To change the default, set the symbol PRVFIL to your choice at MONGEN time.

7.2 LOOKUP, ENTER, RENAME.

7.2.1 Error code #6 may now include BADUFD.

7.2.2 Note that four word LOOKUP'S are still legal. They are distinguished by a non-zero left half of word one.

7.2.3 Rename.

A deficiency in 5.01 is the inability to rename a file and transfer it to a different UFD. It must be copied separately.

7.3 USETO.

When USETO is set past the end of a file, zeroes are written in the file at that time, not later at output time.

7.4 Read Image Mode.

Contrary to DSK016.MEM section 2.1, read image mode is not implemented in either hardware or software.

7.5 CRASH.SAV.

A new once only question asks the size of CRASH.SAV on each file structure. This file is for use with BOOTS (see section 6.1 of this letter) and need not be given any room if BOOTS is not to be used.

7.6 ALCDSK vs ALCFIL.

The cusp described as ALCDSK in DSKØ16.MEM is now named ALCFIL.

7.7 FILE command.

There has been an option switch change in FILE. "D" which formerly meant "DIRECTORY" now means delete. "L" is the new switch for DIRECTORY LISTING.

8. DEFAULT CHANGES

8.1 SYS Protection

When files are copied into SYS, the operator should explicitly set the file protection with PIP or FILEX to 155. Otherwise the standard protection of Ø57 will be substituted thereby preventing access by most of the users. FAILSAFE and FAILCD automatically restore files explicitly to their original protection.

8.2 Tape Density.

Default tape density has been set to 800 BPI.

8.3 Memory Speed.

The default memory speed for shuffle time computations has been set to 1 microsecond.

9. RANDOM INFORMATION OF INTEREST

9.1 The DIRECTORY command now requires a colon (":") after the device name.

9.2 There may be a difference between the number of blocks allocated to a user (printed by LOGOUT) and the number

written (printed by DIRECTORY) if the cluster size is is not one.

9.3 If you want to look at other people's files on UFD'S you must explicitly specify any file structures which they have access to which are not on your search list. The DIRECTORY command will only print files on structures in your search list.

9.4 For a file with protection 455, the owner cannot write or delete. He must rename to a lower protection first. 455 is the protection used by Level C LOGOUT to indicate a "preserved" file.

At our installation, many of our more knowledgeable users rename all their files with PIP to have protection 4XX to speed up LOGOUT. If they choose to do this under Level D, they should make the protection be lXX rather than 4XX.

9.5 LOGOUT when confirming deletion of individual files requires a K and will not accept just a carriage return.

9.6 The number of core blocks used by the monitor is settable at once-only time. Patch symbol CORNUM; each block is worth 4 words.

9.7 If once-only gets a hardware error it puts the controller CONI status in the lights.

9.8 For faster Failsafe operation after refreshing a file structure, use the "/N" switch to prevent LOOKUP'S.

9.9 FTHALT is 1 for this release.

10. IMPLICATIONS OF SOUP

Be sure to keep an inviolate copy of all original sources in this release as a "father" for SOUP updates in the future. We hope to make most future releases with SOUP.

11. 10/40 N and 10/40 D MONITOR

The sources for 5.01 will not produce a 10/40 N or 10/40 D monitor. Some undefined globals occur. This will be rectified in the future with SOUP updates.

12. HOW TO GET ON THE AIR WITH A MAGTAPE DISTRIBUTION

Since you received your monitor distribution on magnetic tape, you will need to read MONITR.OPR sections 1 and 2 and LEVELD.MEM sections 4.2 in order to make a 5 series monitor for your configuration. The magnetic tape contains all of the monitor sources in a Level C FAILSAFE format in project-programmer number 10,7. Thus old customers who already have a disk system, may read the magnetic tape with a Level C FAILSAFE onto their Level C disk system. New customers will receive a monitor already built for their hardware configuration on a DECTape labeled "YOUR MONITOR" (Tape #1). They must read MONITR.OPR section 1 and LEVELD.MEM section 12 in order to start running their system.

MCO 776

symp: Undefined symbol in DPCREF when assembled for 10/40 disk system.

diag: DPCIOC under FTSWAP conditional.

cure: Remove from conditional.

DPCREF

MCO 780

symp: If monitor assembled with FTHALT=-1 monitor halts whenever user has an ILM.

diag: The check in APRINT for PI's in progress must not include the APR PI level itself.

cure: Define a symbol in common (APRNOT) which is all PI's levels except APR for CONSZ PI.

CLOCK1 p. 19
COMMON

MCO 781

symp: Monitor halted in CHKTAL routine with negative CORTAL. Sharable high data segment (write lock off) is destroyed, and then appears to occupy 256K of core.

diag: The sharable high data segment had become idle and got deleted from core under the false assumption that a copy existed on the swapping space (not true for non-write-locked segments).

cure: The FRECR1 routine in SEGCON must be made to recognize this case and cause the segment to be swapped out. However, CORTAL must remain unchanged by this operation.

SCHED p. 43, 46
SEGCON p. 42, 59, 61, 64

MCO 782

symp: FILDDT restricted to searching 48K.

diag: Arbitrary limit imposed in routines SETUP and FETCH.

cure: Remove the limitation.

DELETE {FETCH+6/ CAIL R,30}
 {FETCH+7/ POPJ P, }

CHANGE SETUP+1 MOVEI T,137777 MOVEI T,777777

Return Ø if attempt is made to fetch a word outside the actual CRASH.SAV file

diag: SCNIN routine of SCNSRF using DEVLOG as a temporary.

cure: Use AC17 instead after saving on the stack.

SCNSRF

MCO 787

symp: PRINT ignored an input if the form *.*.)

diag: Code at BLANKQ was ignoring the wrong terminator.

cure: Change BLANKQ:	CAIE CH,33	To BLANKQ:	CAIE CH,33
	CAIGE CH,15		CAIGE CH,15
	JRST CMDERR		JRST DONE
	JRST DONE		JRST CMDERR

PRINT

MCO 788

symp: PRINT and UFILE take an inordinate amount of time to store a command file when the system is heavily loaded.

diag: PRINT and UFILE each do a succession of LOOKUP's until a free name is found that increases in length as the queue increases.

cure: Generate command file names at random using the millisecond time UUO.

UFILE (V005)

PRINT (V005)

MCO 789

symp: Deposit to a high segment appears to work, but later previous contents is restored.

diag: Changed high segment is not swapped out when earlier copy exists in the swapping space.

cure: Call ZERSWP after successful deposit to a high segment.

SEGCON p. 27

MCO 790

symp: 1) In REACT, L DEV:FILE.EXT,PROJ,PROG doesn't work.
Types "? BAD FILE NAME SYNTAX"

2) ?BAD OCTAL NUMBER TYPED WHEN TERMINATING "]" ENCOUNTERED.

diag: 1) FILSPC routine not recognizing "," as a terminator.

2) OCTRD routine not recognizing "]" as a terminator.

cure: Add additional tests.

REACT

MCO 791

symp: 1) ENTER to DECTape fails for no apparent reason and/or

2) FILE appears in DECTape directory with 0 blocks.

diag: a) Test in ENTER code to prevent ENTER to a file open for
reading fails spuriously because index in IBLK is cleared
only on RELEASE.

b) LH of IBLK is used by dead-reckoning code.

cure: a) Clear index used for test on INPUT CLOSE as well as on
RELEASE.

b) In DTASRN use a temporary for dead-reckoning code rather
than IBLK (DEV DAT)

(See further correction in MCO #824)

DTASRN p. 17, 18
DTCSRN p. 17, 34
DTASRN p. 44, 46, 49, 56

MCO 792

symp: HALT in ERRCON in ERRPNT with job # out of range
(when FTHALT=-1). (Trying to print swap read error message).

diag: ERRPNT called with high segment # in ITEM and bits set in
left half.

cure: Replace segment number with associated job # before calling
ERRPNT.

SCHED p. 41
SEGCON p. 60

MCO 793

symp: Parity recovery code is not used (intentional).

diag: 4S74 was distributed with the code purposefully included but never called so that it could be debugged later and small patches sent.

CLOCK1 p. 16

MCO 794

symp: Random locations may be clobbered if operator continues after a parity error halt (i.e. PC was in exec mode or more than one parity error in user mode).

diag: On a parity error halt, the monitor must not attempt to fix up the bad word if parity error did not occur out of the sweep loop.

cure: Check PC on parity error from exec mode. If not in sweep loop, don't try to fix bad word.

CLOCK1 p. 17

MCO 795

symp: Mem parity error message does not print absolute address correctly.

diag: TAC1 instead of TAC was being set up to call OCTPNT.

cure: Set up TAC with absolute address.

ERRCON p. 1, 16, 16-1

MCO 798

symp: High segment MACRO.SHR didn't get marked for later deletion from segment table when MACRO.SHR renamed to MACRO.OLD.

diag: DSKSER now changes filename and extension in DD9 after a RENAME so FNDSEG never found correct high segment when it existed.

cure: Call FNDSEG before RENAME and call CLRNM1 after successful RENAME if shared segment being RENAMED.

UUOCON p. 41

SEGCON p. 68, 72

NULSEG P. 17

MCO 801

symo: PAKLOD doesn't work on RP02's.

diag: Test for which kind of drive is wrong.

cure: Move 2 bits. (2 other trivial changes)

PAKLOD p. 2, 4, 10

MCO 802

symp: Monitor halts in APRINT with PI in progress on APR channel and some lower priority channel.

diag: Out-of-bounds transfer address for user enabled traps leads to loop on APR channel until a lower priority interrupt occurs.

cure: Treat interrupt occurring at trap instruction fetch as though user not enabled for that error and give an error message.

In addition, more code was added to cope with the situation of an ILM that appears to be in EXEC mode, but really only did a JSR on the lower priority interrupt level. This is treated as though ILM occurred directly and lower channel is given a legal address to dismiss to.

CLOCK1 p. 16, 18, 19

SPECIFICATION CHANGE

MCO 805

symo: Can't determine what's a card punch (needed by Fortran).

diag: Can share CDR/CDP with DVCDR, since one is input and one is output.

cure: Set DVCDR in CDPDOB.

CDPSER p. 1

MCO 806

symo: MONGEN asks for dev:file specification for CONFIG but ignores extension even if supplied.

diag: No code to check for user supplied file extension.

cure: Add code.

MONGEN p. 3

MCO 810

symo: FILDDT output showed undefined symbols that should have been defined.

diag: Final part of monitor symbol table lost because EOF encountered.

cure: Remove test for EOF but zero window contents before reading.

FILDDT

MCO 811

symo: Push down list overflow at channel 7 level.

diag: Decoding RUN command at clock level which required deleting a fragmented high segment.

cure: Increase size of NULPDL.

CLOCK1 p. 21, 22

COMMON p. 21, 23

SPECIFICATION CHANGE

MCO 815

symo: User requests that CDP SER ignore RUB-OUTs in ASCII mode.

diag: Seems like a good idea.

cure: CAIN TAC,177
JRST NOPUN

CDP SER p. 19

SPECIFICATION CHANGE

MCO 817

symp: User desires error return on OUT UUO when gets EOT on
MAGTAPE.

diag: Sounds like a winning change.

cure: Change UUOCON exit from OUT UUO to also look for EOT bit.

UUOCON p. 62

MCO 821

symp: DSK not available or
.AS DSK 1 already assigned to JOBØ.

diag: Not enough monitor CORE for DISK DEVICE DATA BLOCKS,
particularly when running COBOL jobs which have 8 open files.

cure: Increase standard size of MINCOR.

COMMON

MCO 824

symp: MCO #791 has introduced an error such that files get
garbled on transfer from DECTape or block too large
error received.

diag: Storing dead-reckoning block # in DTASRN rather than DDB, but
DTASRN switches disconnected tapes. Therefore the number
must be in DDB.

cure: Store in LH of DLOC (previously unused).

DTASRN p. 2, 30, 32

SPECIFICATION CHANGE

MCO 825

symp: Cannot do IB (mode 13) to card reader or punch.

diag: Allow mode 13 and define as I (mode 1Ø).

cure: CDPSE\$: CDPIOS+2/DVOUT+DVCDR,,144Ø3
CDRSRX\$: CDRIOS+2/DVIN+DVCDR,,144Ø3
NOTASC/TRNN IOS,4

CDPSE p.1

CDRSRX p. 1, 6

MCO 826

symp: No error message from card punch when output attempted and device not ready.

cure: Call HNGSTP to warn user if trouble.

CDPSER p. 2

SPECIFICATION CHANGE MCO 827

symp: Cannot do image binary mode output to CDP without handling own buffers.

diag: CDP required different buffer sizes for each of 3 modes:
27 - I, IB
26 - B
16 - A, AL

cure: Add an entry to all devices dispatch table (at XXXDSP-3) which UUOCON will call to set up correct buffer size if it finds buffer size = $\emptyset$ in the device data block.

CDPSER p. 1, 2

UUOCON p. 32

DPCINT p. 1

MCO 828

symp: Halt in CHKTAL claiming core tables (CURTAB) and count of free core (CORTAL) do not agree.

diag: This is produced only on a swap of high sharable data segment. The fix implemented by MCO #781 was not entirely correct.

cure: Instead of using JBTADR (ITEM) to decrement CORTAL, we must use IMGOUT because JBTADR was cleared when core given back.

SEGCON p. 44, 46

MCO 830

symp: Monitor Listing have "," delimiting comments at beginning of a line.

diag: This will not work under new (V43) MACRO-1Ø.

cure: Write TECO macro and run on all monitor files -
Files requiring edit are listed below.

SCHED
UUOCON
PTPSER
PTRSER

SPECIFICATION CHANGE

MCO 831

symp: For systems with more than 64K, DECtapes don't have enough room to accomodate the crash dump.

cure: Use Mag Tapes to save the crash dump. Dataline Systems Mag Tape routine for saving crashes is merged with DEC Tape TENDMP routine. The Mag Tape version of the utility can be assembled by defining MAGT feature test switch.

TENDMP p. 1, 2, 4, 5, 10, 11

MCO 837

symp: "PRINTR" does not recognize VTAB as a valid character.

diag: It should.

cure: Make it - add VTAB to list of valid special characters.

PRINTR

MCO 838

symp: OPFILE does not like user to delete UFD when logging off and leave R or D command pending.

diag: When UFD missing, OPFILE cannot restore to user's UFD since it is not there.

cure: When OPFILE finds missing UFD, have it create a new one.

OPFILE

MCO 839

symp: UFILE pending command (C) is inefficient and inaccurate (when user logs off, then on under a new job #).

diag: (1) Search is by job # instead of PPN.

(2) Command file must be read to determine who user is.

cure: (1) Make ID PPN rather than JOB #.

(2) Include a unique derivative of PPN in command file name, so that most LOOKUPS are unnecessary. Also include a random number in name so that multiple requests from same PPN have a "better" probability of finding a unique command file name on 1st try.

UFILE

MCO 840

symp: Incomplete syntax checking in UFILE - bad syntax not diagnosed until OFILE phase when user has been waiting for some period of time.

diag: OFILE command scan does not check file names and extensions for legal syntax.

cure: Include length check for |NAME| $\leq$ and |EXT| $\leq$ 3 and no DOT following EXT (any other break is legal).

UFILE

SPECIFICATION CHANGE

MCO 841

symp: No convenient way of deleting files from DECTapes thru FILE command.

diag: Seems like a good feature to add.

cure: Add it under "D" command. Change Directory command to "L".

UFILE
OFILE

SPECIFICATION CHANGE
MCO 852

symp: Customers wanted more features in the Logout Cusr.
cure: The following new features have been added:
 D Deletes all files
 F Saves all files
 U Allows you individually decide to save or protect
 all unprotected files

Logout treats files of all extensions the same as
compared to the previous version that treats .TMP etc.
specially.

LOGOUT

MCO 862

symp: Push down list overflow in monitor.
diag: Need more pushdown list space. However, the job data
 area cannot be expanded.
cure: Dynamically assign PD list space from monitor free core,
 and move push down list up to it. Move pushdown list
 back to job data area when returning to user via a UUO.
 The number of 4 word blocks assigned to an extended push-
 down list is EPL4WD, which can be redefined using MONGEN.
 Current setting is 12 (decimal). Pushdown list overflow
 message now means either: (1) not enough free core,
 (2) extended list overflowed too. A record of successful
 and unsuccessful pushdown overflows is kept in COMMON for
 GETTAB UUO.

ERRCON
COMMON
CORE1

MCO 863

symp: TIME Ø command info should be in SYSTAT.
cure: Add shuffle and zero core time to SYSTAT. Add GETTAB to
 find nano-seconds per memory cycle. Remove TIME Ø type-out
 of everything except routine for null job and KILO-CORE-SEC.

CNFTBL table

<u>item</u>	<u>location</u>	<u>use</u>
21	MEMNSP	No. of NANO-SEC PER MEMORY CYCLE (SET BY MONGEN)

COMCON
COMMON

MCO 864

- symp: It takes too much core to load the monitor.
- diag: A significant savings could be effected by having only one copy of DDT around instead of both EXEC DDT and USER DDT.
- cure: Version 24 of DDT has been created which is capable of running in either exec mode or user mode (by containing the code for both options and doing conditional execution instead of being conditionally assembled). This new version will be distributed with the level D disk monitor.

EDDT

MCO 878

- symp: MOVIE does not print more than one line.
- diag: Buffer is only that long
- cure: Make buffer long enough for a 64 job system with 128K of core. Append a CR-LF at end of text and print only the part of buffer stored.

MOVIE

MCO 879

- symp: FILDDT takes 18.5 minutes of CPO time.
- diag: Symbol table search time is very long.
- cure: Make the current symbol table be COMMON most of the time since most symbols are in it and will be found more quickly. Also add local symbols in COMMON .A, .B, ...Z. Use these symbols in FILDDT.TXT for all intermediate symbol definitions. Symbols starting with . are found first since symbol table is sorted in backwards order.

FILDDT.TXT

MCO 880

symp: SYSTAT needed several improvements:

1. Add shuffle, zcore times
- a. Add help command
3. Footnote # and @
4. Leading zero blank or suppress times
5. Print (Self) for P,PN if same as this one unless we are not logged in
6. Prepare to make reentrant
7. Define GOD as Proj. 1, CTY or OPR
8. Make User Core be MEMSIZ-SYSSIZ
9. Report login availability
10. Rearrange null time message
11. Remove extra %s.
12. XLIST Hacques

SYSTAT

MCO 883

symp: Improve SYSTAT:

1. Don't say (SELF) if not logged in
2. Remove unused code
3. Round swap ratio correctly
4. Remove extra comma on file structures
5. Add comments.
6. Print n+nk for job size
7. Print #jobs in system/use/logged in/detached
8. Rearrange some code

MCO 884

symp: MOVIE does not print status of highest job logged in. MOVIE wastes 3 columns by printing null job status and wastes the letter A for null job.

cure: Start job status with job 1 and go through HIGHJB. Use A for low segment of job 1 in core map, B for job 2, etc.

MOVIE

MCO 887

symp: Occasionally the crash procedure does not halt with the
PC - 525252.

diag: Continue switch bounces and an illegal UUO is executed.

cure: Put hald . in AC 10 and then halt with PC pointing to 10.
If MA also set to 10, then continue switch bounced but
caused no problem.

MCO #D-2

symp: EDDT prints octal numbers when symbols are requested.

diag: DDT prints just octal if nearest symbol is more than 100 away.

cure: change to 1000 for exec DDT and FILDDT. A → B
EDDT\$:

MCO #D-3

symp: Many tape read errors on FAILSAFE.

diag: standard density is 556 tape written at 800.

cure: change STDENS in COMMON to 3. so standard density is 800. B → C
MTASRX\$:

MCO #D-7 "Level C bug"

symp: NXM @ 26440 (ANYDEV+15)

diag: Item set wrong.

cure: Do a SOS on -1 (PDP) not 0 (PDP), - which is where item is
saved. E → F

SEGCON\$:

MCO #D-10 "Level C bug"

symp: System hung not responding to ↑C.

diag: A job in core has swp bit on because high seg is swapped out.
The SCNJOB algorithm in swapper does not count jobs in core with
SWP bit on. G → H

cure: Make SCNJOB test JBTHDR for zero rather than SWP bit in order to
ignore jobs.

MCO #D-13

symp: FAILSA changes access dates when it saves files.

diag: Not using CLOSE bit 32.

cure: Change CLOSE FIL, to CLOSE FIL,1Ø
CLOSE CHK, to CLOSE CHK,1Ø
Add CLOSE's before RELEAS'S where necessary.

MCO #D-14

symp: Changed message ASSIGN MTA# FAILSA & THEN RESTART to ASSIGN
MTA# FAILSA & THEN START.

MCO #D-15

symp: When restoring FAILSA overwrites existing disk files if the same
file on tape has an equal creation date and time (on if the disk
file is older).

cure: As of V.26A FAILSA only overwrites existing disk files if they
are older - not if the tape file is equal.

MCO #D-2Ø

symp: K for CRASH.SAV set to 262143 when a file structure is defined.

diag: When a file structure is first defined, K for CRASH.SAV is set
arbitrarily large by once-only. This forces refresher to
allocate maximum amount of contiguous space possible in one
retrieval pointer - determined by the size of the cluster
count field in the retrieval pointer.

cure: Make the documentation clearer.
Note that K for CRASH.SAV is set to 262143 by once-only when
a file structure is defined (e.g. when you dissolve and
recreate the file structure).

MCO #D-22

symp: Refresher takes a long time.

diag: refresher zeros all unused blocks in all files it creates for security reasons.

cure: Set protection to 557 to take care of security problem and do not clear blocks.

MCO #D-24 "Level C bug"

symp: Garbage names for dormant segs in TBTNAM table.

diag: FNDSEG expects extension in DEVEXT (DEV DAT) to be "SHR" and it is not because UREMAP calls IOWAIT, which changes DEV DAT. Happens on GETSEG UCO of a sharable high seg while active I/O on some channels.

cure: PUSH, POP DEV DAT around call to IOWAIT.

MCO #D-27

symp: Swapping space disappears.

diag: Core parity err lights an error bit in IOS, so swapper tries different loc on disk to swap.

cure: Reference bad loc, so OPU will notice error (and stop)

FHXXKON\$:

MCO #D-30 "Level C bug"

symp: PI7 glows a bit, expecially in 64 job system.

diag: COMCNT gets very large, but there are no waiting commands, that is no sign bits set in TTYTAB. This happens when ↑C is sent over a PTY, but I don't know why.

cure: A cure that adjusts COMCNT and at least saves PI7 time is to decrement COMCNT each time:

1. the entire TTYTAB is scanner
2. No delayed commands are found
3. No other waiting commands are found

MCO #D-36

symp:

diag: Core blocks have timing problems.

cure: Interlock FNOFIL routine as if it were a sharable resource.

MCO #D-37

symp: Reduce possibility of timing problems at the cost of some speed.

cure: 1 Monitor buffer instead of 2.

MCO #D-38 "Level C bug"

symp: System hangs in tight loop with PI4 (scanner in progress)

diag: Monitor waiting for CCI buffer empty flag to go off. Never does if PDP-8 is stopped.

BTHINT\$:

MCO #D-39 "Level C bug"

symp: Loop with PI 4 (scanner) in progress.

diag: Talk ring is not complete.

cure: Count TTPLEN times (no. of TTY+PTY+CTY lines) then quit if not got back to beginning.

SCNSRF

MCO #D-48 "Level C bug"

symp: Reproducible NXM with SPY UUO.

diag: Arg too big so NXM adr set up in user relocation.

cure: Give error return if LH of user arg is non-zero or RH is greater than size of Monitor (SYSSIZ)

symp: Hard to measure response time of programs.

cure: Add a command called WATCH which causes monitor to automatically print incremental job statistics. WATCH DAY causes the monitor to print the time of day as (HH:MM.SS) when the user started or continued a program with a monitor command. e.g. START, CONT, R, RUN, COMPIL, SYSTAT, etc. WATCH RUN, WAIT, READ, WRITE causes the monitor to print the incremental run time, the wait time (time since user started or continued program), the incremental number of disk blocks read and the incremental number of disk blocks written as (SS.HH, SS.HH RR, WW) whenever the console is returned to monitor mode via CONTROL C, EXIT, HALT, ERROR IN JOB, DEVICE XXX OK? WATCH with no arguments eliminates the printing of all incremental job statistics. Any combination of the five arguments may be typed in any order. Each occurrence of the WATCH command clears the status of previous commands. The monitor does not print statistics for commands which do not start up jobs, such as ASSIGN, and PJOB. When a user logs in, his job is set to watch all incremental statistics. The system administrator can change this initial setting by redefining MONGEN symbol SETWCH from 3700000 to any other combinations of bits 1 thru 5, as follows:

bit 1 = setting for DAY, bit 2 = setting for RUN
bit 3 = setting for WAIT, bit 4 = setting for READ,
bit 5 = setting for WRITE

Note: That defining SETWCH to be 0 with MONGEN, causes the monitor to print no incremental statistics.

If the user types an invalid argument to WATCH, the monitor responds with:

ARGS ARE: DAY, RUN, WAIT, READ, WRITE

Note that the order of the error message is the same as the order of output. Thus a user who forgets either the arguments or the significance of the statistics can find out. Note also that the incremental commands TIME and DSK terminate an increment in the same way as the incremental job statistics which have been activated by WATCH. These job statistics are included inside brackets as an indication to the user that the type out is incidental to his major interests and is not being typed out by his program. The single space between each pair of number is always typed, whether the number is or not. Thus it is possible to tell which statistics are being typed without seeing the WATCH command.

MCO #D-58 "Level C bug"

symp: A user program can turn off UWP for a spy seg and can write in monitor.

diag: Check for spy seg is not correct.

cure: Give error return if high seg is spy seg.

SEGCON

MCO #D-59 "Level C bug"

symp: FILDOT is very slow. Also typing one control C while it is running returns to command level immediately.

diag: TTCALL UUO is done after every word in a word search.

cure: Do not to TTCALL if input is from a command file.

EDDT

MCO #D-71 "Level C big"

symp: NXM on getting a non-monotonic file.

diag: Expand algorithm in COMCON assumes monotonicity.

cure: Give ADR check in non-monotonic.

EDITED

MCO #D-80 "Level C bug"

symp: Mem parity error in high seg incorrectly reports parity to be beyond end of low seg.

diag: If high seg is below low seg, the difference is negative.

VERSION 5N,01, 5D,01, 5S,01

23 JUN 70

V417

TABLE OF CONTENTS -- PDP-10 MONITOR LISTING
 /TH/CMF TS 32 APR 70 V414

V411	THE FOLLOWING IS THE ORDER OF CONTENTS OF THE MONITOR SOURCES AND SUPPORT CUSPS	
V411	ON THE DEC FURNISHED LISTINGS FOR THIS MONITOR, THEY ARE ARRANGED IN THIS ORDER FOR	
V411	CONVENIENCE TO THE OPERATOR TO AID IN ASSEMBLING THIS MONITOR AND SUPPORTING PROGRAMS.	
V411	FILE NAME	DESCRIPTION
V411	TABLE.TXT	TABLE OF CONTENTS (THIS LISTING)
V411	SYSTEM.MAP	LOADER (SYSTEM BUILDER) STORAGE MAP
V411	GLOB.XRF	GLOBAL CROSS REFERENCE (ALL GLOBAL SYMBOLS)
V415	ALL CCL FILES	FILES TO ASSEMBLE AND PRODUCE BINARY AND LISTING FILES OF ALL MONITOR AND CUSP SOURCES,
V411	MONGEN.LST	CROSS REFERENCE LISTING OF CONFIGURATION DEFINITION PROGRAM,
V411	MONITOR SOURCE	
V411	LISTINGS	CROSS REFERENCE LISTINGS OF MONITOR SOURCE FILES FOUND ON TAPES
V411		4 THROUGH 6, INCLUSIVE, EXCEPT FOR ROUTINES ASSOCIATED WITH DISKS
V414	DISK LISTINGS	CROSS REFERENCE LISTINGS OF DISK ROUTINES - TAPE 15
V411	CUSP LISTINGS	CROSS REFERENCE LISTINGS OF MONITOR SUPPORT PROGRAMS
V411	(NOT FURNISHED)	USED WITH THIS MONITOR,

TABLE OF CONTENTS -- PDP-10 MONITOR
[THESE TAPE NUMBERS CORRESPOND TO THE MASTER DECTAPE NUMBERS]

FILE NAME	DESCRIPTION
-----------	-------------

TAPE 1: YOUR MONITOR	[CREATED FOR DELIVERY OF MACHINE] [IS NOT CREATED FOR SUBSEQUENT SOFTWARE DISTRIBUTIONS]
FAILCD, SAV	RESTORE LEVEL C MAGTAPE TO LEVEL D DISK [USED IF MONITOR IS DELIVERED ON MAGTAPE]

TAPE 2: 10/40 MONITOR MAKER

4N72.REL	LIBRARY FILE TO MAKE 10/40 MONITORS
120.16K	STANDARD 16K 10/30 MONITOR [NEEDED TO LOAD MONGEN, SVE]
SPMON, 16K	SPECIAL 16K 10/30 MONITOR [SAVES IN 10/40, 10/50 FORMAT] [NEEDED TO LOAD 10/40, 10/50 MONITORS]
SPMON, 32K	SPECIAL 32K 10/30 MONITOR [NEEDED TO LOAD 10/40, 10/50 MONITORS]
SPMON, 48K	SPECIAL 48K 10/30 MONITOR [NEEDED TO LOAD 10/40, 10/50 MONITORS]
MONGEN, SVE	MONITOR GENERATOR (CONFIGURATION DEFINITION) [RUNS UNDER 120.16K OR SPMON]
PIP, SVE	PERIPHERAL INTERCHANGE PROGRAM [RUNS UNDER 120.16K OR SPMON]
MACRO, SVE	MACRO ASSEMBLY PROGRAM [RUNS UNDER 120.16K OR SPMON]
LOADER, SVE	RELOCATING LOADER [RUNS UNDER 120.16K OR SPMON]

TAPE 3: ASSEMBLY TAPE

TABLE.TXT	THIS FILE (TABLE OF CONTENTS)
MONTR, OPR	MONITOR ASSEMBLY AND LOADING INSTRUCTIONS
TENDMP, MAC	LOAD/DUMP MONITOR ON DECTAPE
MONGEN, MAC	MONITOR GENERATOR=CREATE CONFIG, MAC VIA DIALOG
MONGEN, SAV	MONITOR GENERATOR (SAV FILE)
FILDDT, TXT	FILDDT INPUT COMMAND FILE
S, MAC	MONITOR PARAMETER DEFINITIONS (LISTED ONLY IN COMMON)
FT40D, MAC	CONFIGURATION DEPENDENT FEATURE TEST SWITCHES FOR (NON-SWAPPING) DISK
FT40N, MAC	CONFIGURATION DEPENDENT FEATURE TEST SWITCHES FOR NON-DISK (NON-SWAPPING) SYSTEM
FT50S, MAC	CONFIGURATION DEPENDENT FEATURE TEST SWITCHES FOR DISK (SWAPPING)
FTTH10, MAC	FEATURE TEST SWITCHES FOR TH100 MAG TAPE CONTROLLER AND DF-10 DATA CHANNEL
CONFIG, MAC	SAMPLE CONFIGURATION DEFINITION FILE (MONGEN OUTPUT - SEE COMMON)
S4NRL, CCL	ASSEMBLE ENTIRE 10/40N - REL ONLY
S4NBTH, CCL	ASSEMBLE ENTIRE 10/40D - REL + CRF
S4DRL, CCL	ASSEMBLE ENTIRE 10/40D - REL ONLY
S4DBTH, CCL	ASSEMBLE ENTIRE 10/40D - REL + CRF
S50RL, CCL	ASSEMBLE ENTIRE 10/50 - REL ONLY
S50BTH, CCL	ASSEMBLE ENTIRE 10/50 - REL + CRF
S50RLX, CCL	ASSEMBLE ENTIRE 10/50 ON DSK - REL ONLY
B00YS, MAC	LEVEL D DISK BOOTSTRAP LOADER (LOAD MONITOR FROM DEVIFILE, EXT(P, PN))

TAPE 4: MONITOR SOURCE FILES

ETHINT	DATA LINE SCANNER + COMPUTER=COMPUTER-INTERFACE = DEVICE DEPENDENT PART OF TELETYPE SERVICE
CCINT	COMPUTER=COMPUTER-INTERFACE = DEVICE DEPENDENT PART OF TELETYPE SERVICE
CDPSR	CARD PUNCH SERVICE ROUTINE
CDRSRX	CARD HEADER SERVICE ROUTINE FOR PDP-10(CR=10)
CLKSS	JOB SCHEDULING ALGORITHM FOR NON-SWAPPING, I.E., 10-40, SYSTEMS
CLOCK1	CLOCK;CONTEXT SWITCHING AND JOB START AND STOP ROUTINES
	APRINT HIGH PRIORITY PROCESSOR INTERRUPT ROUTINE
	CLOCK LOW PRIORITY CLOCK INTERRUPT ROUTINE
	WJCSS ROUTINES TO START AND STOP USER JOBS
COMCON	COMMAND DECODER AND SAVEGET ROUTINES
	COMCON MONITOR COMMAND DECODER AND COMMAND ROUTINES
	COMCSS COMMON SUBROUTINES USED BY MONITOR COMMANDS
	SAVEGET THE SAVE AND GET MONITOR COMMANDS
COMMON	COMMON DATA STORAGE FOR MONITOR (INCLUDES SAMPLE CONFIG.MAC)
	S.MAC SYSTEM PARAMETER FILE ASSEMBLED WITH ALL FILES (LISTED HERE ONLY)
	CONFIG.MAC SAMPLE CONFIGURATION DEFINITION FILE (MONGEN OUTPUT)
CORE1	CORE ALLOCATION AND SHUFFLING
DISSER	CRT DISPLAY SERVICE ROUTINE FOR MODEL 340 OR TYPE 30 DISPLAY
DLINT	DATA LINE SCANNER = DEVICE DEPENDENT INT. SERV. FOR USE WITH TELETYPES
S4RRL4,CCL	ASSEMBLE THIS TAPE FOR 10/40N = REL ONLY
S4DRL4,CCL	ASSEMBLE THIS TAPE FOR 10/40D = REL ONLY
S5RRL4,CCL	ASSEMBLE THIS TAPE FOR 10/50 = REL ONLY

TAPE 51 MONITOR SOURCE FILES

DPCINT	[LEVEL C]
DPDINT	[LEVEL C]
DSKSER	[LEVEL C]
DTASRN	DECTAPE SERVICE FOR PDP-10(TU-55) DECTAPES AND NEW FILE STRUCTURE
EDDT	EXECUTIVE MODE DDT (DYNAMIC DEBUGGING TECHNIQUE)
ERRCON	MONITOR DETECTED ERROR MESSAGE ROUTINES
JOB DAT	SYMBOL DEFINITIONS FOR JOB DATA AREA (BOTH SOURCE CODE AND ASSEMBLY LISTINGS)
LPTSER	LINE PRINTER SERVICE ROUTINE
MOVIE	SNAPSHOT OF SYSTEM IS PRINTED ON LPT BY THIS ROUTINE
MTASRX	MAGTAPE SERVICE ROUTINE FOR PDP-10 MAGTAPE CONTROLLER(TTM10A+TM10B)
NULSEG	DUMMY HIGH USER SEGMENT HANDLING ROUTINES
ONCE	ONCE ONLY OPERATOR DIALOGUE FOR MONITOR START-UP(NON-DISK OR DISK)
PATCH	PATCHING SPACE
PLT SER	CALCOMP PLOTTER SERVICE ROUTINE
PTP SER	PAPER TAPE PUNCH SERVICE ROUTINE
PTRSER	PAPER TAPE READER SERVICE ROUTINE FOR PDP-10(PDP-6)
PTYSRF	PSEUDO-TELETYPE SERVICE ROUTINE (FULL DUPLEX)
SCHED1	SCHEDULAR AND SWAPPER ROUTINES
S4NRL5.CCL	ASSEMBLE THIS TAPE FOR 10/40N - REL ONLY
S4DRL5.CCL	ASSEMBLE THIS TAPE FOR 10/40D - REL ONLY
S50RL5.CCL	ASSEMBLE THIS TAPE FOR 10/50 - REL ONLY

TAPE 61 MONITOR SOURCE FILES

SCNSRF	TELETYPE SERVICE - NEW FULL DUPLEX - SCANNER INDEPENDENT (USES CCINT, OR DLSINT)
SEGCON	HIGH USER SEGMENT HANDLING ROUTINES
SYSINI	MONITOR INITIALIZATION
SYSHAK	MAKE JOB 1 BECOME THE NEW MONITOR (OVERLAY EXISTING MONITOR)
TMPCOR	IN CORE STORAGE ROUTINE FOR CCL FILES (TMPCOR UVO)
UVOCON	UVO TRAP HANDLER AND DEVICE INDEPENDENT UVO ROUTINES
UVOCON	UVO TRAP HANDLER AND DEVICE INDEPENDENT UVO ROUTINES
UOCS	COMMON IO SUBROUTINES
S4NRL6.CCL	ASSEMBLE THIS TAPE FOR 10/40N - REL ONLY
S4DRL6.CCL	ASSEMBLE THIS TAPE FOR 10/40D - REL ONLY
S50RL6.CCL	ASSEMBLE THIS TAPE FOR 10/50 - REL ONLY

TAPE 7: 1.750 MONITOR REL FILES

COMMON.REL	COMMON DATA STORAGE (SAMPLE SYSTEM CONFIGURATION)
COMMOND.REL	LEVEL D COMMON DISK DATA STORAGE (SAMPLE DISK CONFIGURATION)
SS.1.REL	17/50 RELOCATABLE BINARY LIBRARY FILE

TAPE 8: MONITOR SUPPORT CUSPS

ALCFIL.MAC	ALLOCATE FILE SPACE
ALCFIL.SAV	
CHKPNT.MAC	CHECK POINT CURRENT CHARGE FILE AND START NEW ONE
CHAP.T.SAV	
ACCT.SYS	SAMPLE PASSWORD FILE READ BY LOGIN
AUXACC.SYS	SAMPLE PUBLIC DISK QUOTA FILE READ BY LOGIN
SKLST.MAC	LIST DISK FILE STRUCTURE (MFD,UFD,SATS,ETC)
SKLST.SAV	
FAILSA.MAC	SAVE AND RESTORE DISK USING MAGTAPE
FAILSA.SAV	
LOGIN.MAC	VALIDATE PASSWORDS AND CONTROL SYSTEM ACCESS
LOGIN.SHR	
LOGOUT.MAC	LOG USER OFF SYSTEM
LOGOUT.SHR	
FILEDOT.SAV	FILE DOT = EXAMINE A FILE (CRASH.SAV) (ASSEMBLE FROM EDDY.MAC)
C98TH.CCL	ASSEMBLE THIS TAPE FOR BOTH REL AND LISTING
LOOKFL.MAC	LOOK AT A FILE'S EXTENDED LOOKUP/ENTER ARGUMENTS
LOOKFL.SAV	
GRIP.MAC	ENTER USER GRIPES IN [3,3] UFD AS A FILE
GRIP.SAV	

TAPE 9: MONITOR SUPPORT CUSPS

MONEY.MAC	LIST CHARGE FILES AND PRINT TOTALS
MONEY.SAV	
OMOUNT.MAC	PROVIDE OPERATOR INTERFACE FOR FILE AND MOUNT COMMANDS
OMOUNT.SAV	
PLEASE.MAC	PROVIDE OPERATOR CONVERSATION (PLEASE COMMAND)
PLEASE.SAV	
PRINT.MAC	ENTER FILE NAMES IN PRINTR QUEUE FOR LPT
PRINT.SAV	
PRINTR.MAC	OPERATOR CUSP TO PRINT FILES FROM QUEUE
PRINTR.SAV	
REACT.MAC	PREPARE PASSWORD AND QUOTA FILES (ACCT,SYS,AUXACC,SYS,QUOTA,SYS,STRLST,SYS)
REACT.SAV	
SETSRC.MAC	SET AND/OR PRINT JOB FILE STRUCTURE SEARCH LIST
SETSRC.SAV	
SYSTAT.MAC	TYPE SYSTEM SUMMARY ON TTY (SYSTAT COMMAND)
SYSTAT.SAV	
UMOUNT.MAC	ENTER FILE NAMES (FILE COMMAND) OR REMOVABLE VOLUME NAMES (MOUNT COMMAND) IN OPERATOR QUEUE
UMOUNT.SAV	
C98TH.CCL	ASSEMBLE THIS TAPE FOR BOTH REL AND LISTING
NOTICE.TXT	SAMPLE NOTICE OF THE DAY PRINTED BY LOGIN
FILEX.MAC	
FILEX.SAV	CORE IMAGE PROCESSING PROGRAM

TAPE 10: DOCUMENTATION

DSKR16, MEM	LEVEL D&E DISK PROJECT SPECIFICATION
SYSTAT, MEM	DESCRIPTION OF SYSTAT COMMAND PRINTOUT
FAILSA, DOC	DOCUMENTATION FOR LEVEL D FAILSAFE
ERROR, FRM	SOFTWARE ERROR FORM (CASH AND OTHER MONITOR AND CUSP ERRORS)
UNRMCO, FRM	UNRELEASED MONITOR CHANGE ORDER FORM (ABBREVIATED MCO),
CSPSUB, FRM	CUSP SUBMISSION FORM FOR UPDATING SYS
BOOTS, MEM	DOCUMENTATION FOR BOOTS
LOOKFL, MEM	DOCUMENTATION FOR LOOKFL
GRIPE, MEM	DOCUMENTATION FOR GRIPE
DATDMP, MEM	DOCUMENTATION FOR DATDMP
DSKRAT, MEM	DOCUMENTATION FOR DSKRAT
TSTRUN, FRM	SOFTWARE TEST RUN RESULTS FORM
FILEX, MEM	DOCUMENTATION FOR FILEX
QUOLST, MEM	DOCUMENTATION FOR QUOLST
PLEASE, MEM	DOCUMENTATION FOR PLEASE
UMOUNT, MEM	DOCUMENTATION FOR UMOUNT
OMOUNT, MEM	DOCUMENTATION FOR OMOUNT

TAPE 11: DOCUMENTATION

MONSUP, MAN	DESCRIPTION OF DC10E AND TMPCOR UUO
ONCE, FLO	ONCE ONLY FLOW LOGIC
FILSER, FLO	LEVEL D FILE SERVICE FLOW LOGIC
REFSTR, FLO	LEVEL D DISK REFRESHER FLOW LOGIC
LEVELD, MEM	GUIDE TO 5 SERIES MONITOR FILE SYSTEM(LEVEL D)

TAPE 12: TEST PROGRAMS

PARTST, MAC	TEST MEMORY PARITY ERROR RECOVERY
FILTST, MEM	DESCRIPTION OF FILTST LANGUAGE
FILTST, MAC	FILE SYSTEM TEST INTERPRETER
TESTS2, MAC	SERIES OF LEVEL D FILE SYSTEM TESTS
SCRIPT, MEM	DESCRIPTION OF HOW TO RUN SCRIPT
SCRIPT, MAC	TEST SYSTEM BY SIMULATING MANY JOBS FOLLOWING A SCRIPT
TOTAL, F4	PRINT SCRIPT STATISTICS
LINFOR, SCP	LINED/FORTRAN SCRIPT
CPYSYS, SCP	COPY SYS1*, SHR,*, SAV UNTIL QUOTA FILLS UP SCRIPT
DELALL, SCP	DELETE ALL FILES IN TEST DIRECTORY SCRIPT
DMPPIL, MAC	DUMP DISK OR DECTAPE BLOCKS IN OCTAL
FRGSWP, SCP	SCRIPT TO FRAGMENT SWAPPING SPACE
DMPPIL, MEM	DESCRIPTION OF DMPPIL PROGRAM
TECMAC, SCP	TECO/MACRO SCRIPT
PARIO, SCP	
DSKC, SAV	PRINT NO. OF BLOCKS LEFT ON FILE STRUCTURE DSK
DSKC0, SAV	PRINT NO. OF BLOCKS LEFT ON UNIT DSKC0
C12BTH, CCL	ASSEMBLE THIS TAPE FOR BOTH REL AND LISTING
DSKRAT, MAC	EXAMINE A LEVEL D FILE STRUCTURE FOR ERRORS
DSKC1, SAV	PRINT NO. OF BLOCKS LEFT ON UNIT DSKC1
QUOLST, MAC	TYPE JOB'S QUOTAS ON ALL FILE STRUCTURES IN SEARCH LIST
FILLUP, MAC	FILLUP DISK TO TEST THIS CONDITION

TAPE 13: LEVEL D CUSP TAPE

FAILCD,MAC	RESTORE LEVEL C MAGTAPE TO LEVEL D DISK
FAILCD,SAV	
FAILCD,DOC	DOCUMENTATION FOR FAILCD
FAILDC,MAC	SAVE LEVEL D DISK ON LEVEL C MAGTAPE
FAILDC,SAV	
FAILDC,DOC	DOCUMENTATION FOR FAILDC
C13RTH,CCL	ASSEMBLE THIS TAPE FOR BOTH REL AND LISTING

TAPE 14: LEVEL D MONITOR FILE SYSTEM SOURCES

COMM0D,MAC	COMMON DATA BASE FOR DISK DATA
S,MAC	SYSTEM PARAMETER FILE ASSEMBLE WITH ALL FILES (LISTED WITH COMMON ONLY)
CONFIG,MAC	SAMPLE CONFIGURATION DEFINITION FILE (MONGEN OUTPUT)
COMM0D,MAC	LEVEL D FILE SYSTEM DATA BASE
DATDMP,MAC	LEVEL D FILE SYSTEM DATA BASE DUMPER
DATDMP,MAC	DATA BASE DUMPER (EXEC OR USER MODE)
ONCM0D,MAC	DISK ONCE ONLY DIALOG
REFSTR,MAC	DISK REFRESHER
SWPSE,MAC	LEVEL D SWAPPER INTERFACE ROUTINES
S40R14,CCL	ASSEMBLE THIS TAPE FOR 10/400 - REL ONLY
S50R14,CCL	ASSEMBLE THIS TAPE FOR 10/50 - REL ONLY

TAPE 15: LEVEL D MONITOR FILE SYSTEM SOURCES

FILSER,MAC	DISK INDEPENDENT FILE SYSTEM
KONPAR,MAC	CONTROLLER PARAMETER FILE

WORKER,SCP	SCRIPT TO SIMULATE IN-HOUSE T.S. SYSTEM
UPDATE,SAV	PROGRAM USED IN SCRIPT TO TEST SIM. UPDATE
UPDATE,SCP	SCRIPT TO TEST SIMULTANEOUS UPDATE
LOGLOG,SCP	SCRIPT TO TEST SIMULTANEOUS LOGIN/LOGOUT
FILER,SCP	SCRIPT TO TEST USE OF FILE COMMAND,

CHANGES LISTED IN ORDER OF MOST RECENT FIRST
FIRST VERSION IN WHICH CHANGE APPEARED WILL BE PUT ON EVERY LINE
SO CHANGED AT LEFT HAND MARGIN .

CHANGE FROM V416 TO V417
DELETED REFERENCES TO PDP-6 AND
HALF DUPLEX SCANNER 29 JUN 70

CHANGE FROM VERSION V415 TO V416 23 JUN 70

TAPE 31: ADDED BOOTS,MAC
TAPE 81: ADDED C8BTH,CCL,LOOKFL,MAC,LOOKFL,SAV,FILEX,SAV
TAPE 91: ADDED PRINTR,MAC,PRINTR,SAV,GRIPE,MAC,GRIPE,SAV,C9BTH,CCL,FILEX,MAC
TAPE 101: ADDED ERROR,FRM,UNRMCO,FRM,CSPSUB,FRM,BOOTS,MEM,
LOOKFL,MEM,GRIPE,MEM,DATOMP,MEM,OSKRAT,MEM,TSTRUN,FRM,QUOLST,MEM
TAPE 121: ADDED LINFOR,SCP,TESTS2,SAV,SCRIPT,MEM,DMPFIL,MAC
DMPFIL,MEM,DMPFIL,SAV,TECMAC,SCP,DD10F,MAC,DD10F,SAV
DD10F,MEM,C12BTH,CCL,USKRAT,MAC,OSKRAT,SAV,QUOLST,MAC,QUOLST,SAV
REMOVED SCR10S
TAPE 131: ADDED FAILDC,MAC,FAILDC,SAV,FAILDC,DOC,C13BTH,CCL,PIP030,DOC
TAPE 171: ADDED THIS WHOLE TAPE OF TEST PROGRAMS

CHANGE FROM VERSION V414 TO V415 6 MAY 70

TAPE 81: ADDED FILODT,SAV
TAPE 121: ADDED SCR10S

THE TAPES WERE ENTIRELY REORGANIZED FOR 5 SERIES MONITOR,
THE TAPE NUMBERS WERE ARRANGED TO BE THE SAME AS THE LIBRARY TAPE NUMBERS
FOR ORDERING TAPES

CHANGE FROM VERSION V411 TO V412 12 JAN 70

1. REMOVE IJOBS FROM TAPE 3
2. REMOVE RENMON,MAN,HONSPL,MAN AND RENMON,S01 FROM TAPE 8,
3. REMOVE S,MAC AND COMMON,MAC FROM TAPE 9,
4. CHANGE 120,16K TO 121,16K ON TAPE 9,

CHANGE FROM VERSION V410 TO V411 11 JAN 70

1. ADDED TABLE OF CONTENTS OF A DEC FURNISHED LISTING FOR THIS MONITOR,
2. REMOVED SYSTEM MAP AND GLOB,XRF FROM TAPE 1,

CHANGE FROM VERSION V407 TO V410 6 JAN 70

1. MOVED ALL DISK RELATED ROUTINES TO TAPE 4,
2. ADDED IJOB01,02,04 - THE BATCH MONITOR MAKER
3. ADDED TAPE 7 WITH PDP-81 480 ROUTINES + PAL10
4. RENAMED LIBRARY FILES
5. ADDED LEVELC,MEM, SYSTAT,MEM TO MONITOR DOCUMENTATION
6. ADDED OFFILE,UFILE,PLEASE TO SUPPORT CUSPS
7. ADDED PAKLOD - UTILITY DISK PACK LOADER

CHANGED FROM VERSION V406 (-00) 01 JUN 69 TO V407 (-00) 30 JUN 69

TAPE 1, REMOVED MONITR,OPR BECAUSE RUNNING OUT OF ROOM

TAPE 6, ADDED MONITR,OPR

END OF FILE TABLE.TXT

100-100-007-02

"MONITOR, OPR"

MONITOR ASSEMBLY AND LOAD INSTRUCTIONS

TOM HASTINGS/TL/RAP/PEC

28 JUL 1970

V217

CHANGES LISTED IN ORDER MOST RECENT FIRST
FIRST VERSION IN WHICH CHANGE APPEARED WILL BE PUT ON EVERY LINE
SO CHANGED.

CHANGE FROM VERSION V015(-01) TO VERSION V016 (-02) 26 JUL 70

1.5.2 ADDED HOW TO GET ON THE AIR FROM MAGTAPE

2.0.2,2.0.3,2.0.4 ADDED HOW TO MAKE MONITOR FROM MAGTAPE

5.1.2 ADDED HOW TO ASSEMBLE ENTIRE MONITOR ON DSK WITH ONE CCL FILE

9.1 ADDED CRASH PROCEDURE TO WRITE ON DISK WITH BOOTS

CHANGE FROM VERSION V014(-01) TO VERSION V015(01)

CHANGE FROM VERSION V013(-02) TO VERSION V014(-01) 12 APR 70
CONVERT TO LEVEL D.

CHANGE FROM VERSION V012(-02) TO VERSION V013(-00) 13 MAR 70

4.2.5 SAVE (DUMP) PROCEDURE CORRECTED WITH ADDITION OF LINE
"140\$" BEFORE D34S45S SAV

CHANGES FROM VERSION V010(-00) TO VERSION V011(-00) 6 JAN 70

1.3.3 REVISED REFRESH PROCEDURE

3.1.9.1 DESCRIPTION OF MONITOR SOURCES

CHANGES FROM VERSION V007(-00) TO VERSION V010(-00) 30 JUN 69

9. HOW TO SAVE A MONITOR CRASH AND DUMP SYMBOLICALLY WITH FILDDT
ADDED THIS NEW SECTION

QUICK INDEX TO MONITOR,OPR

[J'S INDICATE STEPS NEEDED FOR DISK SYSTEMS (10/400 AND 10/500)
WHICH ARE NOT NEEDED FOR NON-DISK SYSTEMS (10/40N),

1. HOW TO GET ON THE AIR WITH AN EXISTING TIME SHARING MONITOR ON A DECTAPE
 - 1.0 REQUIRED COMPONENTS
 - 1.2 MONITOR ONCE ONLY OPERATOR DIALOG
 - [1.3 MONITOR FILE STRUCTURE DEFINITION AND REFRESH DIALOG (DISK SYSTEMS)]
 - V15 [1.4 COPY CUSPS FROM DECTAPE TO LEVEL D DISK USING FILEX]
OR-
 - V15 [1.5 COPY CUSPS FROM MAGTAPE TO LEVEL D DISK USING FAILOD]
2. HOW TO MAKE A MONITOR FOR YOUR CONFIGURATION FROM LIBRARY FILE
 - 2.0 REQUIRED COMPONENTS
 - 2.0.1 IF MONITOR SOURCES ON DECTAPE
 - V16 2.0.2 IF MONITOR SOURCE ON MAGTAPE
 - V16 2.0.3 COPY MONITOR SOURCES FROM MAGTAPE TO LEVEL C OR D DISK
 - V16 2.0.4 BRIEF (AND FASTER) INSTRUCTIONS TO DO SECTIONS
2.1, 2.2, 2.3, 2.4 UNDER A LEVEL C OR LEVEL D DISK MONITOR.
 - 2.1 DEFINE CONFIGURATION FILE USING MONGEN
 - 2.2 ASSEMBLE S+CONFIG+COMMON [AND S+CONFIG+COMMDD] USING MACRO
 - 2.3 LOAD COMMON [AND COMMDD] WITH MONITOR LIBRARY FILE USING LOADER
 - 2.4 SAVE MONITOR USING MONITOR SAVE COMMAND

3. HOW TO ASSEMBLE MONITOR SOURCES, CREATE LIBRARY FILE,
TO PRODUCE A NEW MONITOR
 - 3.0 REQUIRED COMPONENTS
 - 3.1 ASSEMBLE SOURCES USING MACRO
 - 3.1.1-3.1.6 ASSEMBLE ALL SOURCES AUTOMATICALLY WITH CCL FILES
 - 3.1.7 ASSEMBLE EACH SOURCE BY HAND
 - 3.2 COMBINE RELOCATABLE BINARIES TO MAKE LIBRARY FILE USING PIP
 - 3.3 LOAD MONITOR USING LOADER
 - 3.4 SAVE MONITOR USING MONITOR SAVE COMMAND
4. HOW TO MAKE OUT PATCHES TO YOUR MONITOR
 - 4.0 REQUIRED COMPONENTS
 - 4.1 PATCHING WITH EXEC ODT IN USER MODE WHILE TIME SHARING
 - 4.2 PATCHING WITH EXEC ODT STAND-ALONE EXEC MODE
 - 4.3 PATCHING CONVENTIONS
5. HOW TO ASSEMBLE MONITOR SUPPORT CUSPS
6. HOW TO SAVE A MONITOR CRASH AND DUMP SYMBOLICALLY WITH FILODT

1. HOW TO GET ON THE AIR WITH AN EXISTING TIME SHARING
MONITOR ON A DECTAPE, CUSPS ON DECTAPE [OR MAGTAPE]
 - 1.0 COMPONENTS REQUIRED
 - 1.0.0 A SAV COPY OF THE MONITOR ON A DECTAPE
 - 1.0.1 A CLEARED MACHINE [AND A DISK]
 - 1.0.2 "16K [OR 32K OR 48K] TENDMP" ON PAPER TAPE (MAYBE NEEDED)
- V17 IF CUSPS AND MONITOR SUPPORT CUSPS ARE ON DECTAPE:
 - V17 1.0.3.0 MONITOR SUPPORT CUSP TAPE (TAPE #8)
 - V17 1.0.3.1 CUSP SAV FILES 1
 - V17 1.0.3.2 CUSP SAV FILES 2
 - V17 1.0.3.3 MONITOR SUPPORT CUSPS (TAPE #9)
 - V17 1.0.3.4 TEST PROGRAMS (TAPE #12)
 - V17 1.0.3.5 LEVEL D CUSP TAPE (TAPE #13)
 - V17 1.0.3.6 MORE MONITOR TEST PROGRAMS (TAPE #17)
- V17 [IF CUSPS AND MONITOR SUPPORT CUSPS ARE ON MAGTAPE]:
 - V17 1.0.4.0 FAILCD.SAV ON A DECTAPE (YOUR MONITOR TAPE TAPE # 1)
 - V17 1.0.4.1 CUSPS ON A MAGTAPE (LEVEL C FORMAT)
 - V17 1.0.4.2 MONITOR SUPPORT CUSPS ON A MAGTAPE (LEVEL C FORMAT)

1.1 READ-IN YOUR MONITOR FROM DECTAPE USING TENDMP

V10 BRIEF STEP BY STEP OPERATOR INSTRUCTIONS TO LOAD MONITOR FROM
V10 DECTAPE WITH TENDMP. THESE ARE BRIEF ENOUGH TO BE PLACED ON THE
COMPUTER CONSOLE. THE NEXT FEW PAGES DESCRIBE THIS PROCESS
IN MORE DETAIL.

- V10 1. PUT MONITOR TAPE ON DECTAPE UNIT 2 (DIALED AS 8)
- V10 2. PUSH STOP DOWN(CONSOLE SWITCH)
- V10 3. PUSH RESET DOWN(CONSOLE SWITCH)
- V10 4. PUSH NON EX MEM UP(CONSOLE SWITCH)
- V10 5. PUSH MEMORY PARITY UP(CONSOLE SWITCH)(UNLESS YOU HAVE HAD MEM
V10 PROBLEMS RECENTLY)
- V10 6. PUT UNIT 2 ON WRITE LOCK(DECTAPE UNIT SWITCH)
- V10 7. SET READ-IN DEVICE TO 320(SWITCHES 4,5, AND 7 DOWN, REST UP
V10 ON MAINTENANCE PANEL JUST ABOVE DIGITAL PDP-10 NAME PLATE ON
V10 CO-SOLE)
- V10 8. PUSH READ-IN(CONSOLE SWITCH)
- V10 9. UNIT 2 SHOULD MOVE. IF IT DOES, GO ON TO STEP 10 BELOW
V10 IF PD JUST COUNTS UP, LOAD TENDMP
V10 FROM PAPER TAPE READER:
V10 A. PUSH STOP
V10 B. PUSH RESET
V10 C. PUT TENDMP TAPE IN READER
V10 D. SET READ-IN SWITCHES TO 104(SWITCHES 5 AND 7 DOWN ON MAINT-
V10 ENANCE PANEL JUST ABOVE DIGITAL PDP-10 NAME PLATE ON CONSOLE)
V10 E. PUSH READ-IN
V10 F. PAPER TAPE SHOULD MOVE
V10 G. TENDMP WILL RESPOND WITH CARRIAGE RETURN WHEN LOADED IN
V10 H. READ DIRECTORY BY TYPING:
V10 <ALT-MODE>
V10 10. THE TENDMP ON FRONT OF TAPE AUTOMATICALLY READS IN DIRECTORY
V10 11. LIST THE DIRECTORY (UNNECESSARY IF YOU KNOW ITS CONTENTS) BY TYPING
THE FOLLOWING ON THE CONSOLE TELETYPE (CTY):
V10 F<ALT-MODE>
V15 12. TYPE XXXMON SAV<CR> TO LOAD FILE XXXMON SAV. THE DECTAPE
V15 WILL SPIN AND START UP THE MONITOR. TENDMP WILL TYPE A BELL
V15 IF IT CANNOT FIND THE FILE TYPED IN.
V10 13. THE MONITOR WILL PRINT OUT ITS NAME, DATE, AND VERSION NUMBER,
V10 THEN IT WILL ASK FOR TODAY'S DATE. TYPE IT IN AS MM-DD-YY
V10 FOLLOWED BY A CARRIAGE RETURN. IF THE MONITOR DISCOVERS
V10 SYNTAX ERROR, IT WILL REPEAT QUESTION.
V10 14. THEN THE MONITOR WILL ASK FOR THE TIME OF DAY. TYPE IT IN AS
V10 A FOUR DIGIT 24-HOUR TIME HHMM FOLLOWED BY A CARRIAGE RETURN.
V10 15. MONITOR IS READY TO TIME SHARE.
V10 THE PROGRAM COUNTER LIGHTS ON THE CONSOLE WILL BE 1(THE NULL
V10 JOB) AND ACCUMULATOR 0 WILL COUNT BY ONES.
V15 16. PUSH NXM SWITCH DOWN (UNLESS YOU WISH THE MONITOR TO ATTEMPT
V15 TO RECOVER AUTOMATICALLY).

EXPLANATION OF INSTRUCTIONS TO READ-IN YOUR MONITOR WITH TENDMP. YOU HAVE BEEN PROVIDED WITH A MONITOR WHICH HAS BEEN BUILT FOR AND TESTED ON YOUR MACHINE, (NEW MACHINES ONLY), THIS MONITOR IS ON A DECTAPE LABELED "YOUR MONITOR", TO LOAD THIS MONITOR:

- 1.1.1 MOUNT THIS TAPE ON DECTAPE DRIVE 8 (REFERRED TO IN OCTAL AS DTAB - IN ADDRESSING THIS DRIVE THROUGH THE TELETYPE, IT WILL ALWAYS BE CALLED DTAB ALTHOUGH THE DRIVE IS DIALED TO 8),

NOTE: NO OTHER DRIVE SHOULD BE DIALED TO 8.

- 1.1.2 ASSUME THAT TENDMP HAS BEEN WRITTEN ON BLOCKS 0 AND 1 OF THE DECTAPE. ON THE MAINTENANCE PANEL JUST ABOVE THE DIGITAL PDP-10 NAMEPLATE IS A ROW OF SWITCHES NUMBERED FROM 3 THROUGH 9. SET SWITCHES 4, 5, AND 7 DOWN (BOTTOM PART PUSHED IN) AND ALL THE REST UP (TOP PART PUSHED IN) (DTA DEVICE CODE=320),

- 1.1.3 ON THE LOWER LEFT SIDE OF THE CONSOLE IS A ROCKER SWITCH LABELED NXM STOP. TURN OFF THIS SWITCH (FAR END DOWN). PRESS THE FOLLOWING ROCKER SWITCHES, LOCATED ON THE LOWER PANEL OF THE CONSOLE ON THE LEFT-HAND SIDE, IN THE ORDER GIVEN.

STOP RESET READ IN

DECTAPE UNIT 0 SHOULD MOVE. IF PROGRAM COUNTER LIGHTS (TOP ROW ON RIGHT HAND SIDE OF CONSOLE) START TO COUNT UP, THERE WAS NO TENDMP ON FRONT OF TAPE (USE COPY CUSP /T SWITCH OR PIP /U SWITCH), SO PUSH RESET TO STOP THE RUNAWAY TAPE AND PROCEED TO STEP 1.1.3.1. OTHERWISE THE DECTAPE WILL READ IN THE LOADER PROGRAM TENDMP. WHEN FINISHED, THE TAPE WILL STOP, AND THE TELETYPE WILL MAKE AN AUDIBLE CLICK (PROVIDED IT WAS TURNED ON), THEN PROCEED TO STEP 1.1.4

- 1.1.3.1 ON THE MAINTENANCE PANEL JUST ABOVE THE DIGITAL PDP-10 NAMEPLATE IS A ROW OF SWITCHES NUMBERED FROM 3 THROUGH 9. SET SWITCHES 5 AND 9 DOWN; SET ALL THE REST UP (PTR DEVICE CODE=104),

- 1.1.3.2 LOAD INTO THE PAPER TAPE READER THE TAPE LABELED "TENDMP", INCLUDED IN YOUR SOFTWARE PACKAGE, PRESS THE FOLLOWING ROCKER SWITCHES, LOCATED ON THE LOWER PORTION OF THE CONSOLE ON THE LEFTHAND SIDE, IN THE ORDER GIVEN,

STOP RESET READ IN

THE PAPER TAPE WILL READ AND LOAD THE LOADER PROGRAM TENDMP, WHEN FINISHED, THE TAPE WILL STOP, AND THE TELETYPE WILL MAKE AN AUDIBLE CLICK,

NOTE- A WRITEUP OF TENDMP IS INCLUDED IN THIS PACKAGE,

- 1.1.4 WHEN THE CONSOLE TELETYPE RESPONDS WITH A CLICK, TYPE IN

<ALT=MODE>

NOTE- ON MODEL 37 TELETYPES, THE ALTHODE KEY IS LABELED PREFIX,

DECTAPE 0 (DIALED 8) WILL SPIN FOR A FEW SECONDS, AND THE DIRECTORY WILL BE READ INTO CORE, WHEN IT HAS STOPPED, TYPE

F <ALT=MODE>
("F" FOR FILE NAMES)

THE DIRECTORY OF THE TAPE WILL BE PRINTED,

- 1.1.5 IN THIS DIRECTORY LISTING WILL APPEAR THE NAME OF YOUR MONITOR, IN THE FORM

XXXMON SAV

WHERE THE FIRST THREE LETTERS (XXX) ARE AN ATTEMPT TO REPRESENT YOUR COMPANY'S NAME (E.G., DECHON SAV), TYPE IN THIS NAME (FOLLOWED BY A CARRIAGE RETURN), EXACTLY AS IT APPEARS ON THE LISTING, ON THE CONSOLE TELETYPE, (DO NOT SEPARATE NAME FROM EXTENSION WITH A PERIOD,) THIS ACTION CAUSES DECTAPE 0 TO SPIN AS THE MONITOR IS READ AND LOADED, TENDMP WILL RESPOND WITH A BELL IF IT CANNOT FIND THE FILE OR GETS A PARITY ERROR WHILE READING,

1.2 MONITOR ONCE ONLY OPERATOR DIALOG

1.2.1 THE MONITOR WILL REQUEST THE DATE AND TIME.

TYPE TODAY'S DATE AS ABOVE
MM-DD-YY<CR> (MM = MONTH; DD = DAY; YY = YEAR;
E.G., 12-30-68) (<CR> IS A CARRIAGE
RETURN)

TYPE A 4-DIGIT TIME
TTTT (TTTT = TIME IN 24-HOUR FORMAT;
E.G., 1435 = 2:35 PM)
SEE NOTE BELOW

IF AFTER PERFORMING STEP 1.1.5, THE OPERATOR IS NOT
ASKED BY THE MONITOR FOR DATE AND TIME:

V15
V15
V15

(0) CHECK THAT YOU PUT NXM STOP UP (FRONT), IF YOU DID
NOT, PUT IT UP (BACK SIDE DOWN), THEN PUSH CONTINUE
AND GO ON TO STEP 1.2.2.

(1) SET THE PROGRAM COUNTER SWITCHES TO 000140(0).

(2) PRESS STOP RESET START (IN THAT ORDER).

(3) RESPOND TO DATE AND TIME QUERIES.

NOTE- THE DATE AND TIME RESPONSES MUST BE TERMINATED BY A
CARRIAGE RETURN UNLESS YOURS IS A 10-50 SWAPPING SYSTEM
OR A 10/40 SYSTEM WITH DISK. IN EITHER OF THESE CASES,
YOU WILL WANT TO GO THROUGH THE COMPLETE INITIALIZA-
TION DIALOGUE IN ORDER TO DEFINE YOUR FILE STRUCTURE(S)
AND "REFRESH" (INITIALIZE THE FILE STRUCTURE(S) OF) THE
DISK(S). THE COMPLETE DIALOGUE IS ENABLED BY TYPING
ALTMODE INSTEAD OF A CARRIAGE RETURN AFTER THE FOUR DIGITS
OF TIME.

1.2.2 IF YOUR SYSTEM CONTAINS A DISK SUCH THAT YOU TYPED
ALTITUDE AFTER TIME-OF-DAY, GO TO STEP 1.3. OTHERWISE
(YOU TYPED A CARRIAGE RETURN), YOUR MONITOR IS
ALREADY RUNNING.

IT IS ADVISABLE TO RUN THE SYSTEM WITH THE NXM STOP SWITCH
DOWN SO THAT THE MONITOR WILL STOP IF IT TRIES TO REFERENCE
NON-EXISTENT MEMORY (OR A MEMORY BECOMES INOPERATIVE),
HOWEVER THE MONITOR WILL TRY TO RECOVER FROM SUCH A PROBLEM
AS BEST IT CAN. IF THE NXM SWITCH IS NOT DOWN OR
IF THE OPERATOR PUSHES CONTINUE AFTER A MEMORY STOP
CAUSED BY A NON-EXISTANT MEMORY REFERENCE, USUALLY
ONLY ONE JOB WILL BE AFFECTED (VERY LIKELY IF NO PI'S IN
PROGRESS) AND THE USER WILL RECEIVE AN "ERROR IN JOB"
XXE AT EXEC NNNNNN) UUD AT USER MMMMMM.

V15 IT IS ADVISABLE TO RUN WITH PAR STOP SWITCH UP (NEAR SIDE
V15 UP), RATHER THAN DOWN SINCE MACHINE WILL RUN ABOUT 10
V15 PERCENT FASTER. IF A MEMORY PARITY ERROR OCCURS, THE
V15 MONITOR WILL USUALLY BE ABLE TO RECOVER. THE MONITOR
V15 WILL HALT IF THE PARITY ERROR OCCURRED WHILE A PI WAS
V15 IN PROGRESS OR THE MACHINE WAS IN EXEC MODE SINCE THIS
V15 IS DIFFICULT TO RECOVER FROM RELIABLY. IF THE ERROR
V15 OCCURRED IN USER MODE, THE MONITOR SWEEPS THROUGH ALL OF
V15 CORE. IF IT FINDS EXACTLY ONE PARITY ERROR AGAIN (USUAL)
V15 IT STOPS THE JOB AND PRINTS AN ERROR MESSAGE ON THE
V15 USERS CONSOLE AFTER ATTEMPTING TO FIX THE ERROR BY
V15 RESTORING THE VALUE IT READ OUT OF MEMORY. IF NO
V15 ERRORS OCCUR DURING THE SWEEP, IT IS COUNTED AS A
V15 SPURIOUS ERROR AND THE CURRENT USER CONTINUES. IF
V15 MORE THAN ONE ERROR OCCURS, THE MONITOR HALTS SINCE
V15 A WIDESPREAD MEMORY PROBLEM IS LIKELY. A COUNT OF
V15 THE NUMBER OF PARITY ERRORS IS KEPT ALONG WITH THE
V15 LOCATION OF THE LAST ERROR (SEE GETTAB UUD).

V15 BY SETTING THE ADDRESS SWITCHES (LOCATED IN
V15 THE UPPER ROW OF SWITCHES, ON THE RIGHT SIDE OF THE
V15 CONSOLE) TO ZERO, THE USER CAN OBSERVE THE NULL JOB
V15 COUNTING. EVERY TIME THE NULL JOB IS STARTED UP AFTER
V15 ANOTHER JOB HAS BEEN RUNNING, AC 0 IS RESET TO ZERO.
V15 BY WATCHING AC 0 COUNT, AN ESTIMATE OF NULL TIME BURTS
V15 CAN BE ESTIMATED.

- 1.2.3 REMOVE THE MONITOR TAPE FROM DRIVE DTA* AND MOUNT ON
THE SAME DRIVE THE TAPE IN YOUR PACKAGE LABELED
"COSP SAV FILES".

TYPE *C (HOLD DOWN THE CTRL KEY WHILE STRIKING C),
THE MONITOR WILL RESPOND WITH THE ECHO "*"C" AND START
A NEW LINE WITH A "*,
THEN TYPE

 ,ASSIGN DTA* <CR> THIS INFORMS THE MONITOR THAT
 THE CUSP TAPE IS ON DECTAPE 0
 WHERE IT WILL RESIDE.

- 1.2.4 SINCE YOURS IS A NONDISK SYSTEM, YOU ARE FINISHED AND
MAY PROCEED TO USE YOUR TIME-SHARING POP-10 SYSTEM.

1.3 MONITOR DISK FILE STRUCTURE DEFINITION AND REFRESH DIALOG (DISK SYSTEMS ONLY)

1.3.1 UPON RECEIVING AN ALTMODE FOLLOWING TYPEIN OF THE TIME-OF-DAY, YOUR MONITOR WILL TYPE A SUMMARY OF THE I/O CONFIGURATION FOR WHICH IT WAS BUILT, AND WILL PROCEED TO ASK FOR THE OPERATOR'S CONSOLE NAME, THE DEVICE WHICH YOU SPECIFY WILL BECOME THE ONE TO WHICH MESSAGES FOR LOGICAL DEVICE "OPR" WILL BE SENT, A RECOMMENDED RESPONSE TO THIS QUESTION IS

TTY <CR> (<CR> IS A CARRIAGE RETURN)

V14 1.3.2 NEXT, YOU WILL BE GIVEN THE OPPORTUNITY TO RETAIN
V14 IN CORE THREE OPTIONAL MONITOR COMPONENTS CALLED MOVIE, SYSHAK,
AND EXEC DDT. THESE ARE USEFUL FOR EXAMINING THE CURRENT MONITOR,
FOR CREATING NEW MONITORS, AND FOR DEBUGGING THE CURRENT MONITOR,
RESPECTIVELY. THEY ARE USUALLY NOT RETAINED,

A RESPONSE OF CARRIAGE RETURN WILL DELETE THESE ROUTINES
AND MAKE THE SPACE THEY OCCUPY AVAILABLE AS USER CORE,

V14 YOUR ANSWERS TO THESE THREE QUESTIONS WILL DETERMINE THE
FINAL SIZE OF THE MONITOR (THIS SIZE IS TYPED AT THE
END OF THE ONCE ONLY DIALOG,

V14 1.3.3 NEXT YOU MUST SET UP THE DISK FILE STRUCTURE, FOR
V14 DETAILS SEE LEVELD, MEM SECT, 4.2, AND DSK016, MEM
V14 SECT, 4.2 AND 4.3,

V14 1.3.4 IT IS COMMON PRACTICE TO INCLUDE THE ACCESS PROTECTION
FEATURE CALLED LOGIN IN ALL SYSTEMS CONTAINING DISKS,
THE LOGIN MECHANISM REQUIRES THE PRESENCE OF THREE FILES
ON THE DISK: THE LOGIN CUSP (LOGIN.SAV) AND THE SYSTEM
V14 ACCOUNTING FILES (ACCT.SYS AND AUXACC.SYS), ALTHOUGH YOUR
MONITOR IS NOW RUNNING, THESE REQUIRED FILES ARE MISSING
FROM THE NEWLY REFRESHED DISK, FOR THIS REASON, AN AUTO-
MATIC LOGIN IS ALLOWED FOR THE FIRST USER TO TYPE THE LOGIN
COMMAND AFTER THE DISK HAS BEEN REFRESHED,

TYPE

LOGIN <CR>

THE SYSTEM RESPONDS WITH

JOB1 <YOUR MONITOR NAME>

V14 YOU ARE NOW LOGGED IN UNDER THE PRIVILEGED FAILSAFE
V15 NUMBERS 1,2 SO THAT YOU MAY WRITE ON ANY DISK AREA
WITH ANY CUSP,

SET NXM SWITCH DOWN, MEM PARITY UP, AND ADDRESS SWITCHES
TO 0. SEE SECTION 1.2.2 FOR DISCUSSION OF THESE SWITCHES
AND WHEN IT IS ADVISABLE TO SET THEM DIFFERENTLY,

V15 SAV FILES, SEE FILEX.MEM FOR A COMPLETE DESCRIPTION, THE
1.4 COPY CUSPS FROM DECTAPE TO LEVEL D DISK USING FILEX

V15 (SKIP TO SECTION 1.5 FOR MAGTAPE TO DISK COPYING, IF
V15 YOU RECEIVED THE CUSPS ON MAGTAPE IN FAILCD OR FAILSA FORMAT)

V15 FILEX IS A UTILTIY CUSP LIKE PIP WHICH COPIES FILES FROM
V15 DECTAPE TO DISK AND BACK IN AN EFFICIENT MANNER, IT
V15 ALSO HAS A NUMBER OF OTHER FEATURES SUCH AS CONVERSION TO
V15 AND FROM PDP-6 DECTAPE FORMAT AND EXPANSION OF ZERO-COMPRESSED
V15 SAV FILES, SEE FILEX.MEM FOR A COMPLETE DESCRIPTION, THE
V15 FOLLOWING INSTRUCTIONS WILL SUFFICE FOR COPYING THE CUSPS,

V15 AFTER THE DISK FILE STRUCTURE(S) HAVE BEEN REFRESHED, THE
V15 FIRST USER TO TYPE LOGIN IS LOGGED IN AS 1,2 (THE PRIVILEGED
V15 FAILSAFE NUMBERS),

V15 1.4.1 MOUNT THE MONITOR SUPPORT CUSP WHICH CONTAINS FILEX.SAV
V15 (TAPE #8) ON DTAB,

```

V15 1.4.2 TYPE
V15 ,ASSIGN DTA0
V15 -
V15 DTA0 ASSIGNED
V15 -----
V15 ,RDV DTA0 FILEX 10
V15 -
V15 *DSKB:[1,4]<155>/Q*DTA0!* ,SAV,*,SHR
V15 -
V15
V15 WHERE DSKB IS WHERE YOU WANT YOUR CUSPS STORED BECAUSE
V15 IT IS A LARGE (BUT POSSIBLY SLOWER) FILE STRUCTURE THAN DSKA,
V15 IT CAN BE REFERENCED LATER BY USERS SIMPLY
V15 AS DEV SYS, THE /Q SWITCH STANDS FOR QUICK AND CAUSES
V15 FILEX TO MAKE JUST ONE PASS OVER THE DECTAPE AND
V15 COPY IT QUICKLY ONTO THE DISK, THERE UPON IT SORTS THE
V15 SAV AND SHR FILES AND SETS THE PROTECTION TO 155, THE
V15 1 IS A FLAG TO LOGOUT TO PRESERVE THIS FILE, THE 55
V15 ALLOWS USER'S IN OTHER PROJECTS THAN PROJECT 1 TO READ
V15 THE CUSP FILES, THIS IS NECESSARY ONLY IF THE DEFAULT
V15 FILE PROTECTION IS LEFT AT ITS VALUE OF 057 AS DISTRIBUTED
V15 BY DIGITAL, THE CORE ARGUMENT OF 10 SPEEDS UP THE TAPE
V15 COPY OPERATION, A LARGE CORE ARGUMENT MAY BE USED, IF
V15 NO ARGUMENT IS PRESENT, FILEX WILL EXPAND ITSELF TO A
V15 REASONABLE SIZE FOR USE UNDER REGULAR TIME SHARING
V15 (MUCH LESS THAN 10),
V15
V15 FILEX WILL RESPOND WITH AN * WHEN IT IS THROUGH, JUST
V15 LIKE PIP, MOUNT THE FOLLOWING TAPES IN ORDER AND TYPE
V15 THE COMMAND STRING INDICATED:
V15
V15 CUSP SAV FILES 1
V15 *DSKB:[1,4]<155>/Q*DTA0!* ,*
V15 CUSP SAV FILES 2
V15 *DSKB:[1,4]<155>/Q*DTA0!* ,*
V15 MONITOR SUPPORT CUSPS (TAPE #9)
V15 *DSKB:[1,4]<155>/Q*DTA0!* ,SAV,*,SHR
V15 TEST PROGRAMS (TAPE #12)
V15 *DSKB:[1,4]<155>/Q*DTA0!* ,SCP,*,SAV,*,HGH,*,SHR
V15 INTERIM LEVEL D CUSP TAPE (TAPE #13)
V15 *DSKB:[1,4]<155>/Q*DTA0!* ,SAV,*,SHR
V15 MORE MONITOR TEST PROGRAMS (TAPE #17)
V15 *DSKB:[1,4]<155>/Q*DTA0!* ,SCP,*,SAV,*,SHR

```

1.5 COPY CUSPS AND MONITOR SUPPORT CUSPS FROM MAGTAPE TO LEVEL D DISK USING FAILCD

1.5.1 IF YOUR PDP-10 CONFIGURATION INCLUDES DISK AND MAGTAPE

V15 YOU WILL PROBABLY HAVE RECEIVED YOUR MONITOR AND CUSP SOFTWARE
V15 ON TWO SEPARATE MAGNETIC TAPES IN FAILCD FORMAT (IE LEVEL C
V15 FAILSAFE FORMAT WHICH CAN BE READ BY A LEVEL C FAILSAFE
V15 ONTO A LEVEL C DISK SYSTEM, OR CAN BE READ BY FAILCD
V15 ONTO A LEVEL D DISK SYSTEM,) MAC, REL, SAV, AND SHR FILES
HAVE ALL BEEN COLLECTED TOGETHER IN UFD 10,7 ON EACH TAPE,

V15 THE FOLLOWING TABLE SHOWS THE DIFFERENT VERSIONS OF
V15 FAILSA CUSPS:

V15	FAILSAFE	TAPE TO	DISK TO	TAPE
V15	FAILSA,V16	C	C	C
V15	FAILCD	C	D	-
V15	FAILCD	-	D	C
V15	FAILSA,V27	D	D	D

V15 NOTE: IT IS SUGGESTED THAT EACH OLD CUSTOMER CHANGE
V15 THE NAME OF THE LEVEL C FAILSAFE CUSP HE ALREADY HAS,
V15 TO FAILCD, TO DISTINGUISH IT FROM THE FAILSA BEING
V15 DISTRIBUTED NOW WHICH IS LEVEL D TO D ONLY,

1.5.2 COPY CUSFS FROM MAGTAPE TO LEVEL 0 DISK

V15 AFTER HAVING LOADED THE MONITOR, REFRESHED THE DISK AND
AUTOMATICALLY LOGGED IN UNDER THE FAILSAFE NUMBERS 1,2
(AS DESCRIBED IN SECTION 1.3 ABOVE) MOUNT DECTAPE CONTAINING
FAILCD.SAV ON DECTAPE DRIVE 2 AND THE CUSP MAGTAPE ON MAGTAPE
DRIVE 1. TYPE TO THE MONITOR:

ASSIGN MTA2 FAILSA

FOLLOWED BY A CARRIAGE RETURN, THE MONITOR WILL RESPOND
MTA2 ASSIGNED

(BE SURE THAT THE TAPE AT THE LOAD POINT, ON LINE AND
WRITE LOCKED - RING REMOVED)
ASSIGN DSKB DSK
WHERE DSKB IS YOUR LARGEST FILE STRUCTURE.
(FAILCD WRITES ALL FILES ON DEVICE DSK)

V15 THE TYPE TO THE MONITOR:
RUN MTA2 FAILCD

FOLLOWED BY A CARRIAGE RETURN, FAILCD WILL TYPE:

FOR HELP, TYPE: /H
*

Typing /H WILL CAUSE FAILSAFE TO PRINT A LIST OF SWITCH
OPTIONS AND OPERATING INSTRUCTIONS. YOU MAY WISH TO DO
THIS AT SOME TIME BUT FOR NOW IT IS ONLY NECESSARY TO
TYPE THREE COMMANDS

/R

V15 FOLLOWED BY A CARRIAGE RETURN, THIS WILL INFORM FAIL-
SAFE THAT THE MAGTAPE IS RECORDED AT 800 BITS PER INCH.
FAILSAFE WILL RESPOND WITH AN ASTERISK,
TYPE:

V15 /G: 1,7

V15 FOLLOWED BY CARRIAGE RETURN TO TELL FAILCD YOU WISH
V15 TO OPERATE ON THE 10,7 UFDS ONLY

V16 IF YOU HAVE A LARGE ENOUGH DISK (1 RP02 OR MORE)
V16 IT WILL BE FASTER TO COPY ALL OF THE 12,7 AREA FROM
V16 MAGTAPE TO DISK (SOURCE AND SAVE FILES). HOWEVER IF
V16 YOU HAVE LIMITED SPACE, YOU WILL HAVE TO MAKE 6 PASSES
V16 OVER THE FAILSAFE TAPE IN ORDER TO SELECTIVELY COPY
V16 JUST THE *.REL,*.HGH,*.LOW,*.SAV,*.SHR,QPIP FILES.

V16 IF YOU HAVE A LARGE DISK, TYPE: (COMPUTER OUTPUT IS
V16 UNDERLINED)

V16 **,*
V16 -
V16 *
V16 -

V16 IF YOU HAVE A SMALL DISK, TYPE:

V16 **,*REL,*HGH,*LOW,*SAV,*SHR,QPIP
V16 -
V16 *
V16 -

V16 AFTER FAILCD HAS FINISHED, TYPE:
V16 <CONTROL>C
V16 ,RUN DSK PIP[10,7]
V16 -
V16 *DSKB:[1,4]/X/B*DSK:*,REL,*,HGH,*,LOW,*.SAV,*,SHR,QPIP
V16 -
V16 *
V16 -
V16 YOU MAY WISH TO PUT THE FORTRAN LIBRARY ON A FASTER FILE
V16 STRUCTURE THAN DSKB, TO DO THIS, TYPE:
V16

V16 *DSKA:[1,4]/X/B*DSK:LIB40,REL,DDT,REL

V16 NOTE: IF DSKB IS LARGE ENOUGH AND DSKA APPEARS BEFORE
V16 DSKB IN THE SYS SEARCH LIST, YOU MAY KEEP DUPLICATE COPIES
V16 OF THE LIBRARY ON DSKB (IN CASE DSKA SHOULD GO DOWN),

```

V16      1.5.3 COPY MONITOR SUPPORT CUSPS FROM MAGTAPE TO DISK
V16      NEXT DISMOUNT THE CUSP MAGTAPE AND MOUNT THE MONITOR
V16      MAGTAPE ON THE SAME DRIVE, (SEE SECTION 1.5.2 FOR MORE
V16      INFORMATION),
V16      THEN TYPE TO THE MONITOR:
V16      ,RDN DT2 FAILCD
V16      -
V16      FOR HELP, TYPE: /H
V16      -----
V16      */-
V16      -
V16      */010,7
V16      -
V16      IF YOU HAVE A LARGE DISK, TYPE:
V16      **, *
V16      -
V16      IF YOU HAVE A SMALL DISK, TYPE:
V16      **,SYS,*,SAV,*,SHR,*,HGH
V16      -
V16      *
V16      -
V16      AFTER FAILCD HAS FINISHED, TYPE:
V16      <CONTROL>C
V16      ,R PIP
V16      -
V16      *DEKBI(1,4)/X/B*DSKI*,SYS,*,SAV,*,SHR,*,HGH
V16      -
V16      *
V16      -
V16      IF YOU ALREADY HAVE AN ACCT,SYS AND AUXACC,SYS ON [1,4],
V16      OMIT *,SYS IN ABOVE COMMAND STRING, YOU NOW
V16      HAVE RESTORED THE CUSP AREA EXCEPT FOR YOUR OWN ACCT,SYS,
V16      AND AUXACC,SYS ACCOUNTING FILES,
V16
V16      NOW RESTORE YOUR ACCOUNTING FILES FROM DECTAPE OR DISK
V16      WHEREVER YOU HAVE WRITTEN THEM, IF YOU ARE A NEW
V16      CUSTOMER, YOU WILL NEED TO CREATE THEM, TO DO THIS SEE
V16      SECTIONS 5.6.2 IN LEVELD, MEM, SECTION 13.15 IN DSK016, MEM,

```

V16 1.5.4 RESTORE YOUR ACCOUNTING FILES

ALONG WITH THE CUSPS AN ACCOUNTING FILE (ACCT.SYS) WAS
LOADED WITH THE FOLLOWING ENTRIES:

V14

PROJECT NO.	PROG. NO.	PASSWORD
1	2	FAILS
1	4	CUSP
10	7	DIST
7	7	OPER
6	6	MAINT
100	100	DEM01

YOU WILL PROBABLY WANT TO RUN THE CUSP REACT TO ADD YOUR
OWN NUMBERS AND CHANGE THE PASSWORD FOR FAILSAFE (1,2)
AND CUSP (1,4). YOU SHOULD ASSIGN PROJECT NUMBERS AND
PROGRAMMER NUMBERS STARTING WITH 11 TO YOUR USERS. DIGITAL
HAS RESERVED 1-10 FOR SPECIAL PURPOSES. YOU WILL ALSO NEED
TO MAKE ADDITIONS TO THE DISK QUOTA ADMINISTRATIVE FILE
AUXACC.SYS. THIS IS ALSO DONE WITH REACT. SEE SOFTWARE
NOTEBOOK, LEVELU.MEM SECTION 5.6.2, DSK016.MEM SECTION 13.15.
THE AUXACC.SYS FILE HAS QUOTAS FOR [1,*],[6,*],[7,*],[10,*],[100,*]
OF RSHVD, 100000 FCFS, 100000 LOGGED OUT ON DSKA,DSKB, AND DSKC.

THE SOURCE FILES FOR ALL THE SYSTEM SOFTWARE HAVE BEEN
SAVED WITH FAILSAFE ON MAGNETIC TAPES IN THE FOLLOW-
ING MANNER:

USER AREA CONTENTS

ON MONITOR MAGTAPE:

10,7 SOURCES, MONITOR AND MONITOR SUPPORT CUSPS
DOCUMENTATION, SAV FILES

ON CUSP MAGTAPE:

10,7 CUSP SOURCES AND RELATED ,OPR FILES
DOCUMENTATION, SAV FILES

V14

THESE FILES MAY BE ACCESSED BY LOGGING IN UNDER THE RELAT-
ED NUMBER AND RESTORING THE DESIRED FILES WITH FAILCD.
FILES MAY BE RESTORED EITHER COMPLETELY FOR A USER AREA
OR INDIVIDUALLY. AFTER DOING THIS, IT IS RECOMMENDED
YOU COPY THE FILES FROM DISK TO YOUR OWN DECTAPES FOR SAFE
KEEPING WITH PIP. FOR THE MONITOR SOURCES, BE SURE TO
COPY THEM IN THE PROPER ORDER TO MAKE 17 MONITOR SOURCE
DECTAPES. SEE TABLE.TXT FOR A LISTING OF FILE NAMES FOR
EACH DECTAPE. THE MONITOR ASSEMBLY INSTRUCTIONS ASSUME
THAT THE MONITOR SOURCES ARE ON DECTAPES AND DESCRIBE HOW
TO COPY THEM ONTO THE DISK, IF YOU WISH TO SPEED UP THE
ASSEMBLY PROCESS.

(1.5.2,2 CONT'D)

IF YOU HAVE A SINGLE BURROUGHS DISK (MD-10) IT WILL NOT
HOLD THE CONTENTS OF THE FAILSAFE TAPE, SINCE IT IS
EVER NECESSARY TO RESTORE ALL THE SOURCE FILES AT ONE
TIME THIS SHOULD NOT BE AN INCONVENIENCE.

EXAMPLE:
TO RESTORE ALL LIBRARY SOURCES

LOG IN	USER TYPES LOGIN
JOB 3 4S,45 TS MONITOR	SYSTEM ASSIGNS JOB NO,
#1,7	USER GIVES PROJ,PROG NOS
PASSWORD:	PASSWORD- DOES NOT PRINT
1210 4-JUN-69 TTY3	JOB IS LOGGED IN
*C	
,AR MTA FAILSA	LOGICAL NAME
MTA ASSIGNED	FAILSA REQUIRED
.R FAILSA	
FOR HELP, TYPE: /H	MESSAGE FROM FAILSAFE
,	FIRST * TYPED BY FAILSAFE,
	USER TYPES *,* TO RESTORE ALL
	LIBRARY SOURCES
OR	
FOR HELP, TYPE: /H	
*AXIS,F4,ALPHI,MAC,ALPHO,MAC	USER TYPES NAMES OF SELECTED
	FILES. ONLY THESE ARE RESTORED
	TO THE DISK IN USER AREA 10,7.

2, HOW TO MAKE A MONITOR FOR YOUR CONFIGURATION FROM LIBRARY FILE

2.0.1 REQUIRED COMPONENTS - IF MONITOR SOURCES ARE ON DECTAPE:

2.0.1.1 10/40 MONITOR MAKER TAPE (TO MAKE 10/40 OR 10/50 SYSTEM)
 SP10N,10K MINIMAL 10K SPECIAL 10/30 MONITOR
 SP10N,32K MINIMAL 32K SPECIAL 10/30 MONITOR
 V15 SP10N,48K MINIMAL 48K SPECIAL 10/30 MONITOR
 V15 12N,16K MINIMAL STANDARD 10/30 MONITOR
 V15 (NEEDED TO MAKE MONGEN,SVE)
 PIP,SVE STANDARD 10/30 PIP
 MACRO,SVE STANDARD 10/30 MACRO
 LOADER,SVE STANDARD 10/30 LOADER
 MONGEN,SVE CONFIGURATION DEFINITION PROG.
 TO RUN UNDER 10/30
 V14 5N##,REL MONITOR LIBRARY BINARY TO PRO-
 DUCE 10/40 TIME SHARING SYSTEM
 [WHERE ## IS THE LOAD NUMBER OF THE
 MULTIPROGRAMMING NON-DISK MONITOR]

2.0.1.2 ASSEMBLY TAPE (TAPE #3)

S,HAC SYMBOL DEFINITION FILE ASSEMBLED
 WITH MOST OTHER FILES

2.0.1.3 MONITOR SOURCE FILES (TAPE #4)

COMMON,MAC COMMON DATA STORAGE FOR MONITOR

2.0.1.4 10/50 MONITOR REL FILES (NOT NEEDED FOR 10/40 SYSTEM) (TAPE #7)

V14 5S##,REL MONITOR LIBRARY BINARY TO PRODUCE
 10/50 TIME SHARING SYSTEM
 [WHERE ## IS THE LOAD NUMBER
 OF THE SHAPPING MONITOR]

2.0.1.5 LEVEL D MONITOR FILE SYSTEM SOURCES (TAPE #14) [NEEDED ONLY IF DISK SYSTEM]

COMMOD,MAC COMMON DATA BASE FOR DISK SYSTEMS
 DATDMP,MAC (OPTIONAL) CORE BLOCK DUMPER FOR DEBUGGING

2.0.1.6 MONITOR SUPPORT CUSP,SAV FILES

2.0.1.7 ONE BLANK DECTAPE

2.0.1.8 3 DECTAPE DRIVES (2 CAN BE USED, ALTHOUGH THE
 INSTRUCTIONS ARE WRITTEN FOR 3 UNITS)

2.0.1.9 OPTIONAL - A LINE PRINTER

2.0.1.10 OPTIONAL - A RUNNING TIME SHARING SYSTEM

SKIP TO SECTION 2.1 IF SOURCES ARE ON DECTAPE

```

V16      2.2,2 REQUIRED COMPONENTS - IF MONITOR SOURCES ARE ON MAGTAPE
V16
V16      2. .2,1 A RUNNING LEVEL C (3 OR 4 SERIES) OR LEVEL
V16      D (5 SERIES) MONITOR
V16
V16      2. .2,2 A MONITOR SOURCES MAGTAPE (FAILCD FORMAT
V16      UFD 12,7)
V16
V16      2. .2,3 A DECTAPE WITH FAILCD,SAV ON IT IF THE RUNNING
V16      MONITOR IS A LEVEL D MONITOR. NEW CUSTOMERS
V17      WILL FIND FAILCD,SAV ON THE "YOUR MONITOR TAPE"
V17      (TAPE #1). OTHERWISE THE
V16      LEVEL C FAILSA,SAV ALREADY ON THE CUSP WILL
V16      SUFFICE. THEN DO SECTION 2.0,3 FOLLOWING:
V16
V16      2. .3 COPY MONITOR SOURCES FROM MAGTAPE TO LEVEL C OR D DISK
V16
V16      2. .3,1 IF YOU ARE RUNNING UNDER A LEVEL C DISK MONITOR
V16      YOU MUST ADD A PASSWORD FOR PROJECT, PROGRAMMER
V16      NUMBER [10,7]. BE SURE TO USE LEVEL C (NOT DIS-
V16      TRIBUTED LEVEL D REACT) SINCE YOU ARE RUNNING
V16      UNDER A LEVEL C MONITOR, ANY PASSWORD WILL DO.
V16
V16      IF YOU ARE RUNNING UNDER A LEVEL D DISK MONITOR,
V16      THE ACCT,SYS AND AUXACC,SYS ADMINISTRATIVE FILES
V16      ALREADY HAVE PASSWORD AND DISK QUOTAS RESPECTIVELY
V16      FOR [10,7]. THE PASSWORD IS DIST
V16
V16      2. .3,2 LOGIN UNDER 10,7
V16
V16      2. .3,3 ASSIGN A MAGTAPE, BY TYPING:
V16
V16      ,ASSIGN MTA FAILSA
V16      -
V16      MTA3 ASSIGNED
V16      -----
V16
V16      2. .3,4 MOUNT THE MONITOR FAILSAFE MAGTAPE ON THE UNIT
V16      TYPED OUT BY THE MONITOR (EG MTA0),
V16
V16      2. .3,5 IF RUNNING UNDER LEVEL C, TYPE:
V16
V16      ,R FAILSA
V16      -
V16
V16      (WHERE FAILSA IS LEVEL C FAILSA, NOT DISTRIBUTED LEVEL D FAILSA)
V16      ELSE IF RUNNING UNDER LEVEL D, TYPE:
V16
V16      ,ASSIGN DTA
V16      -
V16      DTA3 ASSIGNED
V16      -----
V16
V16      MOUNT DECTAPE CONTAINING FAILCD,SAV ON IT
V16      (TAPE #1) FOLLOWED BY:
V16
V16      ,RUN DTA3 FAILCD

```

V16 2.0,3,6 TYPE
V16 ASSIGN DSKB DSK
V16 WHERE DSKB IS THE FILE STRUCTURE ON WHICH YOU
V16 WISH TO WRITE THE MONITOR FILES.

V16 2.0,3,7 IF YOU HAVE ONLY 32K OR HAVE 48K OF CORE BUT
V16 ARE RUNNING LEVEL D, THERE WILL NOT BE SUFFICIENT USER CORE TO LOAD A 3 SERIES MONITOR
V16 UNDER TIME SHARING, THEREFORE YOU WILL HAVE
V16 TO LOAD USING SPMON, THE SPECIAL SINGLE USER
V16 MONITOR. THEREFORE TYPE:
V16 *SPMON,32K,SPMON,48K,*,SVE
V16 -

V16 WHICH WILL READ SPMON AND ITS CUSPS ONTO THE DISK,
V16 WHEN FAILSA (OR FAILCD) TYPES *, RESTORE THE
V16 FOLLOWING FILES:
V16 *MONGEN.SAV,S,MAC,COMMON,MAC,SS01.REL,COMMON,MAC,DATDMP,MAC
V16 -

2.0,4 DEFINE YOUR CONFIGURATION USING MONGEN UNDER TIME SHARING

TYPE:

V16 ,RUN DSK MONGEN
V16 -

V16 MONGEN WILL ASK QUESTIONS ABOUT YOUR CONFIGURATION
V17 SEE MONITR,OPR SECTION 2,1 (STARTING WITH
V16 2.1.12). (PUT CONFIG,MAC ON DSK BY TYPING JUST
V16 CARRIAGE RETURN.)

2.0,5 ASSEMBLE COMMON [AND COMMOND] UNDER TIME SHARING

V16 2.0,5,1 ASSEMBLE COMMON BY TYPING:
V16 ,COM S+CONFIG+COMMON/C
V16 -

V16 2.0,5,2 ASSEMBLE COMMOND BY TYPING:
V16 (IF YOUR ARE MAKING A DISK SYSTEM)
V16 ,COM S+CONFIG+COMMOND/C
V16 -
V16 -OR-
V16 ,COM S+CONFIG+DATDMP+COMMOND/C
V16 -

V16 IF YOU WANT TO BE ABLE TO LOOK AT FILSER CORE
V16 BLOCKS IN EXEC MODE FOR DEBUGGING, DATDMP IS
V16 700 LOCS.

```

V16      2. .5.3 OBTAIN CREF LISTINGS BY TYPING:
V16      ,CREF
V16      -

V16      2. .5.4 IF YOU HAVE SUFFICIENT USER CORE TO LOAD A
V16      MONITOR UNDER TIME SHARING, GO TO SECTIONS
V16      2.3 AND 2.4. OTHERWISE YOU MUST COPY SOME
V16      FILES TO DECTAPE BEFORE USING SPMON, AS FOLLOWS:

2.7.6 COPY FROM DISK TO DECTAPE TO BE USED BY SPMON
      (IF NOT ENOUGH USER CORE TO LOAD MONITOR UNDER TIME SHARING)

V16      ,ASSIGN DTA3
V16      -
V16      DTA3 ASSIGNED
V16      -----

V16      WHERE DTA3 CAN BE ANY DECTAPE. REMOVE DECTAPE
V16      CONTAINING FAILED, SAV IF YOU WISH.

V16      MOUNT A SCRATCH TAPE AND ZERO THE DIRECTORY.

V16      ,R PIP
V16      -
V16      *DTA3:=Z
V16      *DTA3://X/B=DSK:SPMON,*,*,SVE
V16      -

V16      LABEL THIS TAPE "10/40 MONITOR MAKER" BECAUSE
V16      IT HAS MOST OF THE FILES WHICH ARE ON THAT
V16      DECTAPE IMAGE. MOUNT A SECOND SCRATCH TAPE
V16      ON DTA3 AND TYPE:

V16      ,ASSIGN DTA3
V16      -
V16      ,R PIP
V16      -
V16      *DTA3:=Z
V16      -
V16      *DTA3://X/B=DSK:COMMON,REL,COMM0D,REL,5S01,REL
V16      -

V16      2. .4.6 NOW, USING TENDMP, LOAD SPMON FROM "10/40 MONITOR
V16      MAKER" DECTAPE YOU HAVE JUST WRITTEN. USE
V16      SPMON,32K IF YOU HAVE 32K, USE SPMON,48K IF
V16      YOU HAVE 48K OR MORE PHYSICAL CORE. SEE SECT 1.1
V17      FOR TENDMP INSTRUCTIONS.

V16      2. .4.7 LOAD YOUR MONITOR WHILE RUNNING UNDER SPMON,
V16      USING LOADER,SVE FROM "10/40 MONITOR MAKER"
V16      DECTAPE. SEE SECTION 2.3 FOR LOADER INSTRUCTIONS.

V16      2. .4.8 SAVE YOUR MONITOR ON DECTAPE! SEE SECTION 2.4.
V16      TO LOAD YOUR MONITOR FROM DECTAPE WITH TENDMP
V16      DO SECTION 1.

```

2.1 DEFINE CONFIGURATION FILE USING MONGEN

2.1.1 MONGEN IS A PROGRAM WHICH WILL ASK YOU QUESTIONS ABOUT YOUR HARDWARE AND SOFTWARE CONFIGURATIONS. YOUR ANSWERS WILL BE WRITTEN AS A MACRO SOURCE FILE NAMED CONFIG,MAC. THEN YOU WILL ASSEMBLE IT WITH S,MAC AND COMMON,MAC TO PRODUCE COMMON,REL. [FOR 10/50 AND 10/40 (LEVEL D DISK) YOU WILL ALSO COMBINE S,MAC, CONFIG,MAC, AND COMMOD,MAC TO FORM COMMOD,REL.] FINALLY YOU WILL LOAD COMMON,REL [AND COMMOD,REL] AND PERFORM A SEARCH ON THE APPROPRIATE MONITOR LIBRARY FILE 5N#,REL OR 5S#,REL. MONGEN MAY BE RUN UNDER A REGULAR 10/40 OR 10/50 TIME SHARING SYSTEM (IF YOU HAVE ONE ALREADY). HOWEVER, THE FOLLOWING INSTRUCTIONS HAVE BEEN WRITTEN FOR THE USER STARTING FROM SCRATCH WITH JUST THE MONITOR DECTAPE SOURCES AND SPMON - THE SPECIAL 10/30 SINGLE USER MONITOR. THE OPERATING INSTRUCTIONS FOR RUNNING MONGEN UNDER TIME SHARING ARE THE SAME AS UNDER SPMON - THE SPECIAL 10/30 MONITOR. NOTE: THE 10/30 MONITORS LOOK FOR AND WRITE A FILE EXTENSION OF ,SVE WHILE 10/40 AND 10/50 MONITORS LOOK FOR AND WRITE ,SAV. THEY CANNOT BE INTERCHANGED BECAUSE THE JOB DATA AREAS ARE INCOMPATIBLE. ALTHOUGH SPMON IS A 10/30 MONITOR, IT IS SPECIAL IN THAT IT WRITES SAVE FILES WHICH ARE COMPATIBLE WITH 10/40 AND 10/50 MONITORS INSTEAD OF 10/30 MONITORS. IT IS USED TO CREATE ,SVE MONITOR FILE WHICH CAN BE LOADED WITH A 10/40 OR 10/50 GET COMMAND FOR DDT PATCHING.

2.1.2 LOAD TENDMP INTO CORE ACCORDING TO THE DETAILED INSTRUCTIONS GIVEN IN SECTION 1.1. IF YOU HAVE 16K OF CORE, USE SPMON,16K; 32K OF CORE, USE SPMON,32K; 48K OR MORE, USE SPMON,48K.

2.1.3 MOUNT "10/40 MONITOR MAKER" (EVEN IF MAKING A 10/50 SYSTEM) ON DECTAPE UNIT 0. SET WRITE SELECT SWITCH ON TOP LEFT ON DECTAPE UNIT TO WRITE LOCK (BOTTOM PUSHED IN). THEN TYPE TO TENDMP
DS (\$ALT=MODE)
TENDMP WILL THEN READ THE DIRECTORY FROM DECTAPE 0.

2.1.4 TYPE
SPMON 16K [OR SPMON 32K OR SPMON 48K]
FOLLOWED BY CARRIAGE RETURN ON THE CONSOLE TELETYPE. TENDMP WILL LOAD AND ACTIVATE A SMALL 10/30 MONITOR. SPMON. TYPE THE DATE AND TIME AS REQUESTED BY SPMON AND SPMON WILL TYPE A PERIOD ON THE CONSOLE TELETYPE TO INDICATE THAT THE USER CAN TYPE MONITOR COMMANDS. THE 10/30 MONITOR COMMANDS ARE ALMOST IDENTICAL TO THE 10/40 AND 10/50 MONITOR COMMANDS.

2.1.5 TYPE

ASSIGN DTA2
FOLLOWED BY CARRIAGE RETURN TO SPMON TO ASSIGN DECTAPE
UNIT 2 (DIAL SET TO 8), NOTE: SPMON'S CONFIGURATION
HAS ONLY DECTAPE UNITS DTA0,DTA1, AND DTA2,

TYPE

ASSIGN DTA1
FOLLOWED BY CARRIAGE RETURN TO SPMON TO ASSIGN DECTAPE
UNIT 1,

TYPE

ASSIGN DTA2
FOLLOWED BY CARRIAGE RETURN TO ASSIGN DECTAPE UNIT 2,
NOTE: IT IS IMPERATIVE THAT YOU ASSIGN ALL THREE
DECTAPES BEFORE YOU USE ANY OF THEM. THIS INFORMS
SPMON THAT YOU INTEND TO USE ALL THREE AND PREVENTS
SPMON FROM TRYING TO USE THE DIRECTORY BUFFER SPACE,

V15
V15
V15
V15

2.1.7 MOUNT A BLANK TAPE ON DECTAPE UNIT 1, THIS TAPE WILL
RECEIVE FILE CONFIG,MAC) SO SET WRITE SELECT SWITCH
ON TOP LEFT OF DECTAPE UNIT TO WRITE (TOP PUSHED IN,
WRITE ENABLED LIGHT SHOULD BE ON),

2.1.8 TYPE

R PIP

FOLLOWED BY CARRIAGE RETURN TO SPMON, TO LOAD AND
START PIP,SVE, THE PERIPHERAL INTERCHANGE PROGRAM,
WHEN DTA0 STOPS SPINNING, PIP WILL TYPE AN * AND WAIT
FOR INPUT, [IF YOU ARE RUNNING UNDER A 10/40 OR 10/50
MONITOR, ALSO TYPE R PIP],

2.1.9 CLEAR DTA1 AND COPY CONFIGURATION DEPENDENT SOURCE

FILES FROM OTHER TAPES, IF THE SOURCES ARE ALREADY
ON THE DISK COPY THEM DIRECTLY FROM THE DISK TO DTA1,
RATHER THAN FROM DTA2 TO DTA1 AS DESCRIBED BELOW, FOR USE
WITH SPMON (SINCE SPMON CANNOT ACCESS THE DISK),

V16
V16
V16

2.1.9.1 TYPE

DTA1:*/Z

FOLLOWED BY CARRIAGE RETURN TO PIP TO CLEAR (ZERO) THE
DIRECTORY ON UNIT 1 IN CASE IT HAS SOME FILES ON IT,
DTA1 WILL MOVE AND PIP WILL RESPOND WITH * WHEN IT
HAS FINISHED,

2.1.9.2 TYPE

<CONTROL>C

BY HOLDING DOWN THE CONTROL KEY (LEFT HAND CORNER OF
KEYBOARD) AND PUSHING C, SPMON WILL RESPOND BY
TYPING *C FOLLOWED BY TWO CARRIAGE RETURN LINE
FEEDS AND A DOT.

V15 2.1.9.3 COPY S,MAC FROM "ASSEMBLY TAPE" (TAPE #3)
V15 TYPE:
V15 ASSIGN DTA2
V15 TO INFORM SPMON THAT A NEW TAPE IS ABOUT TO BE MOUNTED
V15 MOUNT "ASSEMBLY TAPE" (TAPE #3) ON DTA2
V15 TYPE:
V15 START
V15 TO START PIP OVER AGAIN, PIP WILL RESPOND WITH *.
V15 TYPE:
V15 DTA1:/X/B=DTA2:S,MAC
V15 PIP WILL RESPOND WITH AN * WHEN IT HAS FINISHED
V15 THEN TYPE: (DO NOT TYPE AHEAD WITH SPMON, IE WAIT UNTIL *
V15 IS TYPED) <CONTROL>C

V15 2.1.9.4 COPY COMMON,MAC FROM MONITOR SOURCE FILES TAPE (TAPE #4)
V15 TYPE:
V15 ASSIGN DTA2
V15 TO INFORM SPMON THAT A NEW TAPE IS ABOUT TO BE MOUNTED.
V15 MOUNT "MONITOR SOURCE FILES TAPE" (TAPE #4) ON DTA2
V15 TYPE:
V15 START
V15 TO START PIP OVER AGAIN, PIP WILL RESPOND WITH AN *.
V15 TYPE:
V15 DTA1:/X/B=DTA2:COMMON,MAC
V15 PIP WILL RESPOND WITH AN * WHEN IT HAS FINISHED
V15 THEN TYPE:
V15 <CONTROL>C

V15 2.1.9.5 COPY COMMOD,MAC AND DATDMP,MAC FROM "LEVEL D FILE SYSTEM
V15 SOURCES" (TAPE #14)--ONLY FOR DISK SYSTEMS (10/400, 10/50)
V15 TYPE:
V15 ASSIGN DTA2
V15 TO INFORM SPMON THAT A NEW TAPE IS ABOUT TO BE MOUNTED
V15 MOUNT "LEVEL D FILE SYSTEM SOURCES" (TAPE #14) ON DTA2
V15 TYPE:
V15 START
V15 TO START PIP OVER AGAIN, PIP WILL RESPOND WITH A *.
V15 TYPE:
V15 DTA1:/X/B=DTA2:COMMODO,MAC,DATDMP,MAC
V15 PIP WILL RESPOND WITH AN * WHEN IT HAS FINISHED
V15 THEN TYPE:
V15 <CONTROL>C

V15 2.1.11 MOUNT AND START MONGEN
V15 TYPE:
V15 ASSIGN DTA2
V15 TO INFORM THAT A NEW TAPE IS ABOUT TO BE MOUNTED
V15 MOUNT "ASSEMBLY TAPE" (TAPE #3) ON DTA2
V15 TYPE:
V15 RUN DTA2 MONGEN
V15 FOLLOWED BY CARRIAGE RETURN TO SPMON TO LOAD
V15 AND START THE CONFIGURATION DEFINITION DIALOG
V15 PROGRAM, MONGEN.

2.1.12 MONGEN WILL RESPOND WITH
TYPE "DEVICE\NAME<CR>" FOR WHERE TO PUT RESULTS
OF THIS DIALOG, CR ASSUMES "DSK\CONFIG.MAC"

SINCE SPMON DOES NOT HAVE A DSK (LARGER 10/30 MONITORS
HAVE A DISK FILE STRUCTURE WHICH IS INCOMPATIBLE WITH
1/40 AND 10/50 SYSTEMS), TYPE
DTA1:CONFIG
FOLLOWED BY CARRIAGE RETURN TO MONGEN (AFTER YOU
HAVE MADE YOUR MONITOR, YOU WILL BE ABLE TO
RUN MONGEN.SAV UNDER IT INSTEAD OF MONGEN.SVE
UNDER SPMON)

2.1.13 MONGEN WILL TYPE
ANSWER THE FOLLOWING QUESTIONS WITH Y OR N
OR A DECIMAL NUMBER
SHORT DIALOG? [IN=LONGER QUESTIONS]

IT IS RECOMMENDED THAT YOU TYPE N FOLLOWED BY
CARRIAGE RETURN UNTIL YOU ARE MORE FAMILIAR
WITH MONGEN, BECAUSE MONGEN WILL EXPLAIN THE
QUESTIONS MORE FULLY BY TYPING EXTRA COMMENTS
INSIDE SQUARE BRACKETS,

2.1.14 MONGEN WILL WRITE EACH QUESTION,
ANSWER AND SYMBOL DEFINITION IN FILE CONFIG.MAC.
BECAUSE MOST OF THE QUESTION ARE STRAIGHT-
FORWARD, THEY HAVE NOT BEEN INCLUDED HERE, SEE THE
LISTING OF CONFIG.MAC IN MONITOR LISTING OF COMMON
FOR A SAMPLE DIALOG, ONLY A FEW ARE EXPLAINED MORE
FULLY BELOW,

2.1.14.1 TYPE "SYMBOL,VALUE" (VALUE IN DECIMAL)
FOR ANY SYMBOLS TO BE DEFINED, TYPE EXTRA
CARRIAGE RETURN WHEN THROUGH, THEN IT WILL ASK THE
SAME QUESTION FOR OCTAL VALUES,

V14
V14

V15 IF YOU DISCOVER THAT YOU ARE RUNNING MONGEN OFTEN,
V15 IT IS RECOMMENDED THAT YOU EDIT THE BEGINNING OF
V15 COMMON.MAC (AND/OR COMMOD.MAC) SO THAT YOU WILL NOT
V15 ACCIDENTALLY BUILD A MONITOR WITH AN INCORRECT SYMBOL
V15 VALUE, HOWEVER FOR THE FIRST FEW TIMES, CHANGING
V15 THE SYMBOL VALUES WITH MONGEN WILL SUFFICE,

THE FOLLOWING SYMBOLS CAN BE CHANGED TO BE DIFFERENT
FROM THE STANDARD, THEY ARE SHOWN WITH THEIR STANDARD
(DECIMAL) VALUES, IF YOU ARE SATISFIED WITH THE STANDARD,
JUST TYPE CARRIAGE RETURN LINE FEED, IF YOU DO DECIDE
TO CHANGE ONE OR MORE OF THE FOLLOWING SYMBOLS, TYPE
THE SYMBOL FOLLOWED BY ITS DESIRED VALUE SEPARATED BY
A COMMA, PUT EACH SYMBOL DEFINITION ON A SEPARATE
LINE, TYPE AN EXTRA CARRIAGE=RETURN LINE-FEED WHEN DONE,

- 2.1.14.1.3 JIFSEC,02
POWER FREQUENCY IN HERTZ (CYCLES PER SECOND).
SOME INSTALLATIONS SHOULD CHANGE THIS TO
52 SO THAT ACCOUNTING AND TIME OF DAY WILL BE
CORRECT.
- 2.1.14.1.4 DTRY,4
NO. OF TIMES TO TRY ON DECTAPE ERRORS
- 2.1.14.1.5 MTSIZ,128
SIZE OF MAGTAPE RECORDS
- 2.1.14.1.6 LPTSIZ,26
SIZE OF LPT BUFFER*2,
THIS SHOULD BE MADE 29 IF YOU HAVE 132 CHAR
LINE PRINTER AND WANT TO PRINT ON ALL COLUMNS
WITH FORTRAN.
- V14 2.1.14.1.7 NSPMEM,1760
NUMBER OF NANO-SECONDS PER MEMORY CYCLE
V15 (SHOULD BE 1760 FOR MB10 MEMORIES), THIS
IS ONLY USED TO COMPUTE THE AMOUNT OF TIME
V15 SPENT CORE SHUFFLING AS PRINTED BY THE
SYSTAT COMMAND.
- V15 2.1.14.1.8 MINCOR,JOBN*54 [LEVEL=C ONLY]
THE MONITOR RESERVES A TABLE OF AT LEAST MINCOR WORDS
(POSSIBLY MORE UP TO THE NEXT 1K BOUNDARY FOR ALLOCATING
DISK DEVICE DATA BLOCKS, MINCOR IS NORMALLY 54*JOBN
WORDS ALLOWING 1.5 OPEN DISK FILES PER JOB. IF THE
VALUE FOR MINCOR IS TOO SMALL IT MAY BE SUPPLIED
DURING THE MONGEN DIALOGUE. THE TOTAL SIZE OF THE
MONITOR IS PRINTED OUT AFTER THIS SPACE IS RESERVED
IN THE LONG ONCE ONLY DIALOG. (SEE 1.3).
- 2.1.14.1.9 LOGSIZ,2
MINIMUM AMOUNT OF VIRTUAL CORE REQUIRED IN ORDER
TO ALLOW A USER TO BE LOGGED IN, IF THIS AMOUNT
IS NOT AVAILABLE, USER WILL RECEIVE USUAL CORE
UNAVAILABLE MESSAGE INCLUDING AMOUNT OF VIRTUAL
CORE LEFT. THIS VALUE MUST BE AT LEAST AS BIG AS
LOGIN CUSP (CURRENTLY 2K)

V14	2.1.14.1.11	STRMAX,14
V14		THE MAXIMUM NUMBER OF DISK FILE STRUCTURES
V14		WHICH CAN BE ON LINE AT ONE TIME, DECREASING
V14		THIS VALUE SAVES ONE WORD PER VALUE.
V14	2.1.14.1.12	CCWMAX,10
V14		THE MAXIMUM LENGTH OF A DISK CHANNEL COMMAND
V14		LIST, ALTERING THIS VALUE AFFECTS ONLY
V14		THE EFFICIENCY AND SPACE [1 WORD PER CHANNEL].
V14	2.1.14.1.13	SWPMAX,8
V14		THE MAXIMUM NUMBER OF DISK UNITS WHICH MAY BE
V14		USED FOR SWAPPING, [1 WORD PER UNIT].
V14	2.1.14.1.14	SWCLSN,7
V14		THE HIGHEST CLASS NUMBER FOR SWAPPING.
V14	2.1.14.1.15	DSKTRY,3
V14		NO. OF TIMES TO TRY ON DISK ERRORS.
V14	2.1.14.1.18	CHVIFP,10
V14		STANDARD FAIRNESS COUNT FOR POSITIONING.
V15		[SEE USK016, MEM SECTION 10.3.3]
V14	2.1.14.1.19	CH0IFP,CHVIFP ... CH7IFP,CHVIFP
V14		FAIRNESS COUNT FOR POSITIONING ON CHANNEL 0,...,7.
V14	2.1.14.1.20	CHVIFT,10
V14		STANDARD FAIRNESS COUNT FOR TRANSFERS.
V14	2.1.14.1.21	CH0IFT,CHVIFT ... CH7IFT,CHVIFT
V14		FAIRNESS COUNT FOR TRANSFERS ON CHANNEL 0,...,7.
V14		[SEE USK016, MEM, SECTION 10.3.3]
V14	2.1.14.1.22	PTRLEN,10
V14		NUMBER OF IN-CORE RETRIEVAL POINTERS PER DISK
V14		DOB.
V14	2.1.14.1.23	EPL4WD,12
V14		ONE-FOURTH THE LENGTH OF THE MAXIMUM EXEC PUSH
V14		DOWN LIST EXCURSION.

V15	2.1.14.1.24	FIL4WD,10
V15		NO. OF 4 WORD BLOCKS ALLOCATED PER JOB IN A COMMON
V15		POOL OF MONITOR FREE CORE. THE ONCE ONLY CODE
V15		MULTIPLIES THIS FACTOR TIMES THE NUMBER OF
V15		JOBBS THE SYSTEM IS BUILT FOR TO ASSIGN THIS SPACE.
V15		THESE BLOCKS ARE USED BY THE LEVEL D DISK
V15		SERVICE FOR ACTIVE, DORMANT, AND FREE ACC, AKB, NMB, PPB,
V15		AND UFB BLOCKS. THIS POOL IS PERMANENTLY
V15		RESERVED FOR THESE, BLOCKS AND IS NOT USED FOR
V15		ANY OTHER PURPOSE. ANOTHER POOL IS USED FOR
V15		VARIABLE LENGTH CORE BLOCKS SUCH AS DISK
V15		DEVICE DATA BLOCKS, AND EXTENDED EXEC PUSH DOWN
V15		LISTS. ENTERUUD ERROR CODE 16 (ERNET) IS
V15		SET IF THIS POOL FILLS UP. IF THIS
V15		HAPPENS REGULARLY, INCREASE THE VALUE OF FIL4WD.
V15		THE MINIMUM NUMBER OF 4 WORD BLOCKS IS 50 FOR THE SYSTEM.
V14	2.1.14.1.25	UNVRSF,500
V14		THAT RECIPROCAL FACTOR OF THE TOTAL DISK SIZE
V14		ON EACH UNIT ONTO WHICH USERS COULD NEVER WRITE THEIR DATA.
V14		THIS SAFETY FACTOR ENSURES THERE IS ALWAYS ROOM
V14		TO WRITE THE SECOND RIB, ETC. I.E, ONE FIVE
V14		HUNDRETH OF THE DISK SPACE IS RESERVED FOR THIS PURPOSE.
V14	2.1.14.1.26	LBNHOM,1
V14		LBZHOM,10
V14		STANDARD LOGICAL BLOCK NUMBERS ON EACH UNIT
V14		CONTAINING THE HOM BLOCK.
V14	2.1.14.1.27	MFDI2,8
V14		NUMBER OF BLOCKS ALLOCATED TO THE MFD IN EACH
V14		FILE STRUCTURE BY THE REFRESHER. THE MFD CAN GROW
V14		LONGER THAN THIS. HOWEVER A SPEED ADVANTAGE
V14		OCCURS IF THE MFD IS CONSECUTIVE BLOCKS. INCREASE
V14		THIS VALUE IF YOU DISCOVER YOUR MFD IS USUALLY
V14		LONGER THAN 8 BLOCKS.
V14	2.1.14.1.30	MBFN,1
V14		NUMBER OF 128-WORD MONITOR BUFFERS. (USED
V14		FOR READING AND WRITING NON-USER DATA).

2.1.14.2 TYPE "SYMBOL,VALUE" (VALUE IN OCTAL)

FOR ANY SYMBOL VALUES TO BE CHANGED FROM THE STANDARD
LISTED BELOW. TYPE AN EXTRA CARRIAGE RETURN WHEN THRU.

V15 2.1.14.2.1 STDENS,3 [OCTAL]

STANDARD MAGTAPE DENSITY IF USER PROGRAM DOES NOT
OVERRIDE WITH NON-ZERO VALUE IN INIT, OPEN, OR
SETSTS 000.

- 1 BINARY (000) PARITY + 200 BPI
- 2 BINARY (000) PARITY + 556 BPI
- 3 BINARY (000) PARITY + 802 BPI
- 5 BCD (EVEN) PARITY + 200 BPI
- 6 BCD (EVEN) PARITY + 556 BPI
- 7 BCD (EVEN) PARITY + 800 BPI

V15 2.1.14.2.2 INDPN,2 [OCTAL]
V15 IF INDPN=0, THEN EACH PROGRAMMER NUMBER REFERS
V15 TO THE SAME PERSON IN EVERY PROJECT.
V15 IF INDPN=777777, THEN PROGRAMMER NUMBERS MAY BE
V15 ASSIGNED INDEPENDENTLY WITHIN EACH PROJECT.
V15 THIS AFFECTS ONLY THE DISK FILE ACCESS PROTECTION
V15 MECHANISM. [SEE DSK016.MEM, SECTION 7.2.2]

V15 2.1.14.2.3 PRVFIL,057 [OCTAL]
V15 STANDARD FILE PROTECTION.

V15 2.1.14.2.4 PRVUFD,775 [OCTAL]
V15 STANDARD UFD PRIVILEGE.

V15 2.1.14.2.5 SETWCH,000000 [OCTAL]
V15 INITIAL SETTING OF WATCH PARAMETERS FOR EACH JOB IS ALL TURNED
V15 OFF. SEE WATCH COMMAND FOR A DESCRIPTION OF JOB STATISTICS.
V15 THESE JOB STATISTICS ARE TYPED INSIDE BRACKETS
V15 WHEN A USER STARTS TO WAIT FOR THE SYSTEM OR
V15 WHEN THE CONSOLE RETURNS TO COMMAND LEVEL.
V15 BIT 1 = DAY (200000)
V15 BIT 2 = RUN (100000)
V15 BIT 3 = WAIT (400000)
V15 BIT 4 = READ (200000)
V15 BIT 5 = WRITE (100000)

2.1.15 PI CHANNEL ASSIGNMENTS CAN BE CHANGED FROM THEIR STANDARD VALUES WHEN ADDING SPECIALIZED I/O ROUTINES FOR CUSTOMERS' NON-STANDARD DEVICES.

PI ASSIGNMENTS ARE MADE BY GROUPING I/O DEVICES BY RELATIVE SPEED OF INTERRUPTS, AS SHOWN BELOW. IF ANY DEVICE IN A GROUP IS PRESENT, A PI CHANNEL WILL BE ASSIGNED TO THAT GROUP, THUS THE EXACT PI ASSIGNMENT FOR A GIVEN DEVICE VARIES DEPENDING ON THE PRESENCE OF OTHER DEVICES.

IN ADDITION, THE DEVICES ADDED BY A CUSTOMER DURING THE MONGEN DIALOG WILL BE CHAINED ON THE REQUESTED CHANNEL, IF A DEVICE REQUIRES THE EXCLUSIVE USE OF A PI CHANNEL, THAT MAY BE DECLARED TO MONGEN AFTER DECLARING THE NAME OF THE SPECIAL DEVICES.

THE DEVICE GROUPS ARE AS FOLLOWS (THESE MAY BE CHANGED BY RE-ARRANGING THE DEVICES IN INTTAB, IN THE SOURCE OF COMMON):

GROUP NUMBER (NOT PI CHANNEL)	DEVICE MNEMONIC	NAME
1	DCB	136 DATA CONTROL FOR 270 DISK
2	MTA	TM10A DATA CHANNEL
3	DCT	136 DATA CONTROL FOR 291 OR 516 TAPE CONTROLS
4	DTA	TD10 DECTAPE DATA CHANNEL
5	CDR	461 OR CR10 CARD READER
5	APR	KA10 OR 166 ARITHMETIC PROCESSOR
6	SCN	DC10,680, OR 630 TELETYPE SCANNER
6	PTR	PAPER TAPE READER
6	LPT	LINE PRINTER(S)
6	DTA	DECTAPE FLAG CHANNEL (DTA OR DTC)
6	MTA	MAGTAPE FLAG CHANNEL
6	CTY	CONSOLE TELETYPE
7	DSK	DISK FLAG CHANNEL (FHD,MDF,OPC, OR OPD)
7	PEN	LIGHT PEN
7	PTP	PAPER TAPE PUNCH
7	CDP	CARD PUNCH
7	PLT	PLOTTER
8	DIS	DISPLAY DATA CHANNEL
9	CLK	SCHEDULER, CLOCK ROUTINES, (ALWAYS ASSIGNED TO CHANNEL 7.)

V11

2.2 ASSEMBLE S+CONFIG+COMMON [AND S+CONFIG+COMMON] USING MACRO

2.2.1 WHEN MONGEN TYPES "EXIT ?C", YOU HAVE CREATED
FILE CONFIG,MAC (ON DTA1 IF USING SPMON), NOW
YOU MUST ASSEMBLE IT WITH S,MAC AND COMMON,MAC
TO PRODUCE COMMON,REL.

2.2.2 TYPE
ASSIGN DTA2
FOLLOWED BY CARRIAGE RETURN TO SPMON TO
ASSIGN DECTAPE UNIT 2,

2.2.3 MOUNT A BLANK TAPE ON DTA2
SET THE UNIT TO WRITE ENABLED
TYPE:
R PIP
CLEAR THE DIRECTORY ON DTA2 BY TYPING:
DTA2:*/
PIP WILL RESPOND WITH A * WHEN IT IS DONE
THEN TYPE:
(CONTROL) C

2.2.4 TYPE
R MACRO
FOLLOWED BY CARRIAGE RETURN TO SPMON, TO LOAD
AND START MACRO, THE SYMBOLIC ASSEMBLER.
MACRO WILL TYPE AN * AND WAIT FOR INPUT.
[IF YOU ARE RUNNING UNDER A 10/40 OR
10/50 MONITOR INSTEAD OF SPMON, ALSO TYPE
R MACRO].

2.2,5 TYPE

V15 DTA2:COMMON=DTA1:IS,CONFIG,COMMON
FOLLOWED BY CARRIAGE RETURN TO MACRO,
THE ASSEMBLER WILL MAKE TWO PASSES OVER THE
SOURCE FILES AND PRODUCE COMMON.REL ON
DECTAPE UNIT 2. WHEN MACRO IS FINISHED, IT
SHOULD PRINT NO ERRORS DETECTED
FOLLOWED BY *. IF THE ASSEMBLER SHOULD DETECT
SOME ERRORS, CHECK YOUR MONGEN DIALOG,
ESPECIALLY WHERE YOU DEFINED SPECIAL SYMBOLS
OR DEVICE ROUTINES, MAKE SURE THAT YOU
SEPARATED EACH FIELD WITH A COMMA AND
TYPED NO SPACES. (MONGEN TAKES EACH SUCH
LINE AND PASSES IT DIRECTLY TO CONFIG.MAC).
IF YOU CANNOT FIND YOUR ERROR, PERFORM
THE ASSEMBLY OVER AGAIN WITH A LISTING:
DTA2:COMMON,LPT1:DTA1:IS,CONFIG,COMMON
AND LOOK TO SEE WHERE ERROR OCCURRED,

V15 [FOR LEVEL D DISK SYSTEMS ONLY, ALSO TYPE:
V15 DTA2:COMMON=DTA1:IS,CONFIG,COMMON
V15 TO MACRO AFTER IT HAS FINISHED PREVIOUS ASSEMBLY
V15 AND HAS TYPED *
V15 IF YOU ARE INTERESTED IN LOOKING AT THE LEVEL D CORE
V15 BLOCKS WHILE RUNNING IN EXEC MODE, TYPE THE FOLLOWING
V15 COMMAND STRING INSTEAD:
V15 DTA2:COMMON=DTA1:IS,CONFIG,DATDMP,COMMON
V15 THIS WILL INCLUDE DATDMP WHICH IS ABOUT 700 OCTAL LOCATIONS LONG
V15]

2.2,6 TYPE

V14 <CONTROL>C
TO MACRO AFTER IT HAS FINISHED ASSEMBLY AND HAS
TYPED * TO
RETURN TO SPHON COMMAND LEVEL.

- 2,3 LOAD COMMON,REL (AND COMMOD,REL) FOLLOWED BY MONITOR LIBRARY
FILE USING LOADER. (SEE REFERENCE HANDBOOK FOR EXPLANATION OF
LOADER COMMANDS AND SYMBOLS.)
- 2.3.1 TYPE
R LOADER
FOLLOWED BY CARRIAGE RETURN TO SPMON WHICH WILL LOAD
LOADER.SVE WHICH IS A STANDARD LOADER SAVED TO RUN UNDER
A 11/30 MONITOR INSTEAD OF A 10/40 OR 10/50 MONITOR,
[IF YOU ARE LOADING UNDER TIME SHARING INSTEAD OF SPMON
ALSO TYPE R LOADER]. [IF YOU ARE MAKING A 10/50 SYSTEM
YOU MUST REPLACE THE "10/40 MONITOR MAKER" (TAPE #2) TAPE
WITH THE "10/50 MONITOR REL FILES" TAPE (TAPE #7) AFTER YOU
HAVE GOTTEN THE LOADER OFF OF IT (WITH THE R COMMAND), TO
DO THIS TYPE <CONTROL>C FOLLOWED BY!
V14 ASSIGN DTAB
SO THAT SPMON WILL KNOW TO READ THE DIRECTORY AGAIN,
THEN REPLACE "10/40 MONITOR MAKER" TAPE (TAPE #2) WITH
"10/50 MONITOR REL FILES" TAPE (TAPE #7) AND FINALLY TYPE!
START
TO SPMON TO RETURN TO THE LOADER]
- 2.3.2 NEXT YOU MUST TYPE THE LOADER COMMAND STRING TO CAUSE
IT TO LOAD YOUR TAILOR MADE COMMON,REL FROM DTAB AND
DO A LIBRARY SEARCH OF SN##,REL OR SS##,REL ON
DTAB. THE LONG MONGEN DIALOG TYPED OUT THE APPRO-
PRIATE COMMAND STRING FOR YOU TO USE. THE FOLLOWING
V14 SECTIONS, 2.3.2 THROUGH 2.3.4 DESCRIBE THE LOADER
COMMAND STRINGS. IN CASE YOU DID NOT SPECIFY THE
LONG DIALOG. IF YOU DISCOVER YOU MADE A MISTAKE BEFORE
TYPING /G, YOU MAY START LOADER OVER AGAIN MERELY BY
TYPING <CONTROL>C
START
FOLLOWED BY CARRIAGE RETURN TO MONITOR.
- 2.3.3 TYPE
/S
FOLLOWED BY CARRIAGE RETURN, TO LOAD LOCAL SYMBOLS FOR
DEBUGGING THE MONITOR WITH EXEC DDT OR PATCHING WITH
EXEC DDT (STAND-ALONE IN EXEC MODE OR UNDER TIME SHARING
IN USER MODE).
- 2.3.4 TYPE
DTAB:COMMON,DTAB:SN##/L
FOLLOWED BY CARRIAGE RETURN IF YOU ARE BUILDING A 10/40
NON-DISK SYSTEM OR TYPE!
V14 DTAB:COMMON,COMMOD,DTAB:SS##/L
FOLLOWED BY CARRIAGE RETURN IF YOU ARE BUILDING A LEVEL 0
DISK SYSTEM (10/40 U OR 10/50) SYSTEM. THE /L TELLS THE
LOADER TO DO A LIBRARY SEARCH RATHER THAN LOAD EVERY FILE
V14 IN SN##,REL OR SS##,REL. COMMON,REL CONTAINS THE PROPER
EXTERNAL DECLARATIONS TO LOAD JUST THE ROUTINES NEEDED FOR
YOUR CONFIGURATION.

2.3.5 TYPE1

LPT1:/A/M/P/G

V15 NOTE: EXEC DDT (EDDT V24) WILL EXECUTE EITHER IN EXEC
V15 MODE OR USER MODE, SO THAT ONLY ONE COPY OF DDT WILL
V15 SUFFICE FOR PATCHING UNDER TIME SHARING OR STAND-ALONE.

THE LOADER WILL PRINT A STORAGE MAP ON THE LINE
PRINTER AND WILL TYPE
EXIT
WHEN IT IS THROUGH, IF YOU DO NOT HAVE A LINE PRINTER,
TYPE
/P/G
FOLLOWED BY CARRIAGE RETURN

THE /A PRECEDING THE /M CAUSES
THE LOADER MAP TO INCLUDE ALL GLOBAL SYMBOLS
INCLUDING ZERO LENGTH FILES (JOB DAT), THE /P SWITCH
PREVENTS THE LOADER FROM SEARCHING THE LIBRARY IN
CASE THERE ARE UNDEFINED GLOBALS, THE /G IS EQUIVALENT
TO ALTMODE AND SEEMED LESS CONFUSING TO INCLUDE HERE
SINCE THE USER CAN END ALL COMPUTER INPUT WITH CARRIAGE
RETURN.

INSTEAD OF PUTTING THE STORAGE MAP ON THE LINE
PRINTER YOU MAY WISH TO PUT IT ON DTA2 INSTEAD FOR
LATER PRINTING, IF SO TYPE

DTA2:XXXXMON=/A/M/P/G

V14 WHERE XXXMON IS THE NAME OF YOUR MONITOR, THE LOADER WILL
V14 WRITE STORAGE MAP AS FILE XXXMON.MAP ON DTA2, IF YOU GET
ANY MULTIPLY DEFINED GLOBALS CHECK TO SEE THAT YOU TYPED
/L IMMEDIATELY FOLLOWING 5N## OR 5S##, IF LOADER
RUNS OUT OF CORE, IT WILL PRINT CORE EXCEEDED FILE
5N## [OR 5S##] CHECK TO MAKE SURE YOU ARE USING THE
LARGEST SPMON FOR YOUR MEMORY SIZE (SPMON,16K,SPMON,32K,
SPMON,48K) IF YOU WERE NOT, RELOAD LARGEST SPMON WHICH
WILL FIT IN YOUR MEMORY AND GO BACK TO STEP 2.3. CHECK
TO MAKE SURE YOU TYPED /L AFTER THE LIBRARY FILE, OTHER-
WISE LOADER WAS ATTEMPTING TO LOAD ALL FILES, TO RECOVER,
TYPE <CONTROL>C START TO MONITOR, IF CORE IS STILL
EXCEEDED TYPE <CONTROL>C START AND REPEAT STEPS 2.3,3
THRU 2.3,5 EXCEPT DO NOT LOAD LOCAL SYMBOLS(/S,).
IF THIS FAILS TRY LOADING WITHOUT EXEC DDT (MUST REPEAT
MONGEN DIALOG AND ANSWER N), AND WITHOUT LOCAL SYMBOLS.

2.4 SAVE MONITOR USING MONITOR SAVE COMMAND

2.4.1 YOU HAVE JUST LOADED YOUR MONITOR INTO CORE USING
LOADER. NOW YOU MUST SAVE IT ON DECTAPE SO THAT
IT CAN BE LOADED BY TENDMP.

V15 TYPE
SAVE DTAP XXXMON

FOLLOWED BY A CARRIAGE RETURN TO SPMON, WHERE XXXMON
IS THE NAME YOU WOULD LIKE TO GIVE TO YOUR MONITOR.
SPMON WILL WRITE FILE XXXMON,SVE ON DTAP2. IF YOU
ARE RUNNING UNDER TIME SHARING, THE MONITOR WILL WRITE
FILE XXXMON,SAV INSTEAD. TENDMP WILL BE ABLE TO LOAD
EITHER.

V15 WARNING - NEVER COPY A ,SVE OR ,SAV FILE ONTO A DECTAPE
V15 WITH PIP WHICH YOU MAY WISH TO LOAD WITH TENDMP (EG
V15 MONITOR OR SOME MAINTENANCE PROGRAMS). ALWAYS
V15 USE THE MONITOR GET AND SAVE COMMANDS INSTEAD. PIP
V15 (WITH /B SWITCH) IS FINE FOR ORDINARY USER PROGRAMS AND
V15 CUSPS EVEN THOUGH THEY ALSO HAVE EXTENSIONS OF SAV AND
V15 SVE SINCE YOU WILL NEVER LOAD THEM WITH TENDMP.
V15 THE REASON FOR THIS RESTRICTION IS THAT TENDMP
V15 ASSUMES THAT THE FIRST BLOCK OF A FILE IS THE
V15 LOWEST ONE ON THE TAPE FOR THAT FILE. TENDMP
V15 WOULD HAVE TO BE LARGER IF IT WAS TO BE MADE
V15 COMPATIBLE.

2.4.2 DECTAPE DTAP2 SHOULD NOW CONTAIN THE FOLLOWING FILES

V14 COMMON,REL [IF LEVEL-D DISK]
COMMON,REL [IF YOU WROTE STORAGE MAP HERE]
XXXMON,MAP [OR XXXMON,SAV IF UNDER TIME SHARING]
XXXMON,SVE

V16 2.4.3 AFTER BRINGING UP YOUR LEVEL D MONITOR,
V16 LOGIN UNDER 1,4 AND SAVE YOUR MONITOR ON A SLOW SPEED FILE
V16 STRUCTURE WITH THE NAME SYSTEM,SAV. THEN YOU WILL BE ABLE
V16 TO LOAD IT MERELY BY TYPING CARRIAGE RETURN TO BOOTS,

3. HOW TO ASSEMBLE MONITOR SOURCES, AND CREATE LIBRARY FILE TO PRODUCE A NEW MONITOR.

3.0 REQUIRED COMPONENTS

V14 3.0.1 A RUNNING TIME SHARING SYSTEM EITHER 10/40 OR 10/50,
V14 YOU WILL USE THE FOLLOWING CUSPS: MACRO(VERSION 42
OR LATER), PIP, FUDGE2(OPTIONAL), COMPIL(OPTIONAL).

V14 3.0.2 THE MONITOR SOURCE DECTAPES LABELED:
V14 MONITOR SOURCE 3
V14 MONITOR SOURCE 4
V14 MONITOR SOURCE 5
V14 MONITOR SOURCE 6
V14 MONITOR SOURCE 14 [LEVEL-D SOURCE]
V14 MONITOR SOURCE 15 [LEVEL-D SOURCE]

V16 - OR -

V16 MONITOR SOURCES ON A FAILSAFE MAGTAPE.

3.1 ASSEMBLE MONITOR SOURCES AUTOMATICALLY USING THE MACRO INDIRECT FEATURE

V14 3.1.1 TWO METHODS OF ASSEMBLING THE MONITOR ARE DESCRIBED HERE,
ONE IS AUTOMATIC AND ASSEMBLES EVERY ROUTINE OF THE
MONITOR WITH A SINGLE COMMAND STRING. IT USES THE INDIRECT
FEATURE OF MACRO TO READ A FILE OF COMMANDS. IT WILL EVEN
WORK ON 10/40 SYSTEMS PROVIDED THAT 7 DECTAPES ARE AVAILABLE.
THE SECOND METHOD (SECTION 3.2) DESCRIBES HOW TO ASSEMBLE
EACH ROUTINE INDIVIDUALLY AND IS INCLUDED FOR COMPLETENESS
ONLY. REFER TO IT IF YOU WISH TO MAKE UP A MACRO INDIRECT
COMMAND FILE WHICH ASSEMBLES ONLY THE SOURCES FOR YOUR
CONFIGURATION.

V14 MACRO INDIRECT FILES APPEAR ON MONITOR SOURCE TAPE 3
V14 FOR 10/40 SYSTEMS, AND EACH SOURCE TAPE FOR 10/50 SYSTEMS,
V14 ALL WITH EXTENSION ".CCL". THE XXXRL3.CCL, XXXRL5.CCL,
V14 XXXRL6.CCL FILES PRODUCE JUST BINARY FROM SOURCE TAPES
V14 4,5,6. THE XXXBTH.CCL FILES PRODUCE BOTH BINARY AND CREF
V14 INPUT FROM ALL SOURCE TAPES. S94RLX.CCL ASSEMBLES ALL
V16 SOURCES FROM DISK AND PUTS BINARIES ON DISK. IT IS
V16 THE RECOMMEND WAY IF YOU HAVE ENOUGH DISK SPACE(50000 BLOCKS).
MORE THAN ONE FILE IS REQUIRED BECAUSE OF THE
LIMITATION OF 22 FILES ON A DECTAPE AND THE DESIRE TO
BE ABLE TO ASSEMBLE BINARIES WITH JUST 4 DECTAPES.
THE FOLLOWING CHART SHOWS THE DEVICES NEEDED IN
ORDER TO PERFORM THE ASSEMBLY.

	FILE NAME	REL	LST	#DTA	#MTA	INPUT	OUTPUT
V14	S4 RLN,CCL	Y	NO	3	0	3,N	RLN
V14	S4 BTH,CCL	Y	Y	7	1	3=6	RL4,RL5,RL6,M
V14	S5 RLN,CCL	Y	NO	3	0	3,N	RLN
V14	S5 BTH,CCL	Y	Y	11	1	3=6	RL4,RL5,RL6,M
V14						14=15	RL14,RL15
V16	S50RLX,CCL	Y	NO	0	0	DSK	DSK

THE INDIRECT FILES HAVE BEEN DESIGNED SO THAT A DISK IS NOT REQUIRED. HOWEVER THE ASSEMBLY PROCESS CAN BE SPEED UP BY COPYING SOME OR ALL OF THE SOURCES ONTO THE DISK AND PUTTING THE BINARY ONTO THE DISK.

V14 ALL OF THE FILES EXPECT THE FOUR MONITOR SOURCES TO
V14 APPEAR ON LOGICAL DEVICES 3,4,5,6,14 AND 15 RESPECTIVELY.
V14 SEE LISTING OF TABLE, TXT ON MONITOR SOURCE TAPE 3
FOR DIRECTORY LISTING OR CONSULT THE DECTAPE DIRECTORIES
THEMSELVES. THE BINARIES ARE PUT ON LOGICAL DEVICES
V14 RL4, RL5, RL6, RL14 AND RL15. UNFORTUNATELY 2 DEVICES
ARE REQUIRED SINCE THERE WILL BE MORE THAN 22 BINARY FILES.
THE CREF INPUT IS WRITTEN ON LOGICAL DEVICE M WHICH MUST
BE A MAGTAPE UNLESS YOU HAVE A VERY LARGE DISK.

V14 IF YOU HAVE A DISK THE GREATEST SAVINGS CAN BE ACCOM-
V14 PLISHED BY COPYING ALL OF MONITOR SOURCE TAPE 3
ONTO THE DISK AND ASSIGNING DSK THE LOGICAL NAME "3".
THIS IS BECAUSE ALMOST EVERY ASSEMBLY MUST READ S,MAC
AND ABOUT HALF THE APPROPRIATE FEATURE FILE ON LOGICAL
V14 DEVICE 3. IF YOU HAVE ENOUGH ROOM, YOU CAN COPY ALL
V14 6 TAPES OF THE MONITOR SOURCES ONTO THE DISK AND
V14 ASSIGN THE DSK AS LOGICAL DEVICES "3","4","5","6","14",
V14 AND "15".

V14 SECTIONS 3.1.2 THROUGH 3.1.6 DESCRIBE HOW TO USE EACH
OF THE EIGHT CCL FILES TO PRODUCE RELOCATABLE BINARY
AND/OR LISTINGS OF THE MONITOR.

V16 3.1.2 FILE S50RLX,CCL WILL PRODUCE JUST MONITOR BINARY
V16 FILES FOR A 10/50 SYSTEM WITH A DISK(5000 BLOCKS NEEDED).
V16 NO DECTAPES ARE NEEDED.

V16 3.1.2.1 COPY ALL MAC FILES ONTO DISK. (USE FAILOD LOGGED-IN UNDER 10,7).
V16 3.1.2.2 TYPE:
V16 .R MACRO
V16 -
V16 *S50RLX,CCL@
V16 -
V16

3.1.3 FILES S40RL4.CCL AND S40RL5.CCL S40RL6.CCL WILL PRODUCE
JUST MONITOR BINARY FILES FOR A 12/4K
SYSTEM WITH 3 DECTAPES,

V14

3.1.3.1 TYPE

V14 ASSIGN DTA 3
V14 ASSIGN DTA 4
V14 ASSIGN DTA RL4

V14 TO ANY TIME SHARING MONITOR, THE MONITOR WILL RESPOND
V14 WITH THE PHYSICAL DEVICES ACTUALLY ASSIGNED, MOUNT
V14 MONITOR SOURCE TAPE 3 ON LOGICAL UNIT "3",
V14 MONITOR SOURCE TAPE 4 ON LOGICAL UNIT "4",
V14 AND A BLANK TAPE ON LOGICAL UNIT "RL4". MAKE SURE
V14 "3", AND "4" ARE WRITE LOCKED AND THAT "RL4" IS SET
V14 TO WRITE,

3.1.3.2 COPY THE CCL FILE ONTO "RL4":

V14 ,R PIP
V14 *RL4:/Z*DTA3IS40RL4.CCL/B/X
V14 *<CONTROL>C

3.1.3.3 ASSEMBLE SOURCE TAPE 4
BY TYPING:

,R MACRO

TO THE MONITOR, FOLLOWED BY:

V14 RL4IS42RL4.CCL@

V14 FOLLOWED BY A CARRIAGE RETURN TO MACRO, WHERE @ IS THE
"EACH" SIGN (NOT ALT-MODE), THIS WILL CAUSE MACRO TO READ
COMMAND FILE S40RL4.CCL, IT WILL TYPE OUT THE TITLE OF
EACH PROGRAM AS IT IS ASSEMBLED. IT WILL PRINT THE NUMBER
OF ERRORS ONLY IF IT FINDS ANY (WHICH IT SHOULDN'T),
WHEN ALL THE ASSEMBLIES ARE COMPLETE, MACRO WILL PRINT
EXIT AND THE TELETYPE WILL BE RETURNED TO MONITOR MODE.

3.1.3.4 LIST THE DIRECTORY OF LOGICAL DECTAPE "RL4", BY TYPING:

V14 ,R PIP
*TTYI*RL4:/L
*<CONTROL>C

V14 TO THE MONITOR AND PIP, CUT OUT AND TAPE THE DIRECTORY
ON THE UNIT RL4.

V14 3.1.3.5 REMOVE LOGICAL DECTAPE "RL4", MOUNT A SECOND
BLANK TAPE ON LOGICAL UNIT "RL4"

3.1.3.6 TELL THE MONITOR THAT YOU HAVE MOUNTED NEW DECTAPES BY
TYPING THE ASSIGN COMMAND FOR EACH PHYSICAL UNIT, THIS
IS IMPORTANT! IF YOU DO NOT DO THIS, THE MONITOR WILL
USE THE DIRECTORY IT HAS IN CORE RATHER THAN THE ONE ON
TAPE,
EXAMPLE: ASSUME THAT THE MONITOR HAD ASSIGNED PHYSICAL
V14 DEVICE DTA7 AS LOGICAL UNIT "RL4".
V14 TYPE
V14 ASSIGN DTA7 RL5
V14 SIMILARLY, ASSIGN "5" ON THE DRIVE USED FOR "4".

V14 3.1.3.7 REPEAT STEPS 3.1.3.2 THROUGH 3.1.3.6 FOR EACH TAPE
TO BE ASSEMBLED.

V14 3.1.4 FILE S40BTH.CCL WILL PRODUCE 90TH MONITOR REL (RELOCATABLE BINARY) FILES AND GREF INPUT IN PARALLEL FOR A 10/90 SYSTEM USING A 10/40 SYSTEM WITH 1 MAGTAPE AND 7 DECTAPES.

V14 3.1.4.1 USE THE MONITOR ASSIGN COMMANDS TO ASSIGN SEVEN DECTAPES WITH LOGICAL NAMES "3","4","5","6", "RL4", "RL5", AND "RL6"; ALSO ASSIGN A MAGTAPE "M", MOUNT MONITOR SOURCES 3,4,5, AND 6 ON LOGICAL UNITS "3","4","5", AND "6" AND BLANK DECTAPES ON LOGICAL UNITS "RL4", "RL5", AND "RL6", CLEAR THE DIRECTORIES ON "RL4", "RL5" AND "RL6" USING PIP AND COPY S40BTH.CCL FROM LOGICAL UNIT "3" TO "RL4". INITIATE THE ASSEMBLY PROCESS BY TYPING:

V14 .R MACRO <CR>
V14 *RL4:S40BTH.CCL* <CR>

V14 3.1.5 FILES S50RL4.CCL, S50RL5.CCL AND S50RL6.CCL, ETC., WILL PRODUCE JUST REL (RELOCATABLE BINARY) FOR A 10/90 SYSTEM USING EITHER A 10/40 OR A 10/50 SYSTEM WITH 3 DECTAPES.

V14 3.1.5.1 TO ASSEMBLE THE MONITOR WITH JUST FOUR DECTAPES PROCEED AS FOLLOWS:

V14 .ASSIGN DTA 3
V14 .ASSIGN DTA 4
V14 .ASSIGN DTA RL4 [MAKE LOGICAL ASSIGNMENTS CORRESPOND TO .CCL FILES]
V14 [MOUNT MONITOR SOURCES 3,4 ON LOGICAL UNITS "3","4",
MOUNT A BLANK DECTAPE ON LOGICAL UNIT "RL4" WRITE ENABLED]
V14 .R PIP
V14 *RL4:Z*4:S50RL4.CCL/B/X [COPY CCL FILE]
V14 * <CONTROL>C
V14 .R MACRO
V14 *RL4:S50RL4.CCL* [INITIATE FIRST PORTION OF ASSEMBLIES]
V14 EXIT'' [MACRO TERMINATES]
V14 .R PIP
V14 *TTY:RL4:L [LIST THE DIRECTORY OF UNIT "RL1"]
V14 * <CONTROL>C
V14 .ASSIGN DTAN RL5 [WHERE DTAN IS PHYSICAL UNIT ASSIGNED TO "RL1"]
V14 [REMOVE TAPE FROM RL1, ATTACH IT'S DIRECTORY AND MOUNT A BLANK DECTAPE ON WHAT IS NOW LOGICAL UNIT RL2]
V14 REPEAT ABOVE SUBSTITUTING "RL5" FOR "RL4" AND "5" FOR "4"
V14 REPEAT AGAIN FOR EACH TAPE,

V14 THE FOLLOWING INSTRUCTIONS ASSUME THAT YOU HAVE A DISK WHICH WILL HOLD AT LEAST MONITOR SOURCE TAPE 3, ZERO DISK DIRECTORY.

3.1.5.2 COPY THE MAC FILES ON MONITOR SOURCE TAPE 3 TO
THE DISK BY TYPING

V14 .ASSIGN DTA 3

V14 TO THE MONITOR AND MOUNTING MONITOR SOURCE TAPE 3 ON
THE PHYSICAL UNIT THE MONITOR ASSIGNED.

TYPE

.R PIP

TO THE MONITOR FOLLOWED BY

V14 *DSK:/X/B*31*.MAC

TO PIP WHICH WILL CAUSE PIP TO TRANSFER ALL OF THE FILES
WITH EXTENSION .MAC TO THE DISK. THE /X SWITCH CAUSES PIP
TO RETAIN THE SAME NAMES ON THE DISK, RATHER THAN

V14 COMBINING ALL OF THE FILES INTO ONE. THE /B SWITCH MEANS
COPY IN BINARY AND SHOULD ALWAYS BE USED WHEN COPYING WITH
/X AS A HABIT BECAUSE WITHOUT IT, PIP DOUBLES THE LENGTH OF YOUR FILE
WHEN GOING FROM DISK TO DECTAPE. USING THE /B SWITCH
IS ALSO A GOOD HABIT SINCE YOU NEVER HAVE TO WORRY ABOUT
WHETHER THE DATA IS REALLY BINARY OR NOT.

3.1.5.3 COPY AS MANY OF THE OTHER MONITOR SOURCES ONTO THE DISK AS
YOU HAVE ROOM FOR ALTHOUGH JUST TAPE 3 GREATLY INCREASES
EFFICIENCY AS S.MAC AND THE FEATURE FILES ARE ON IT. BE
SURE TO ASSIGN THE DECTAPE UNIT BEFORE MOUNTING EACH
TAPE. AT LEAST THE CCL FILES MUST BE COPIED TO DISK.

V14

V14

3.1.5.4 FOR EVERY MONITOR SOURCE TAPE THAT YOU ARE GOING TO LEAVE
ON THE DECTAPE DRIVES, MAKE SURE THAT YOU HAVE GIVEN THEM
THE APPROPRIATE LOGICAL NAMES "4", "5", AND "6", ETC. FOR
EVERY TAPE YOU COPIED TO THE DISK TYPE:

V14

V14 .ASSIGN DSK 3

V14 .ASSIGN DSK 4

V14 .ASSIGN DSK 5

V14 .ASSIGN DSK 6

V14 ETC.

IT IS POSSIBLE TO GIVE THE DISK MANY LOGICAL NAMES
SIMULTANEOUSLY WHILE EACH DECTAPE CAN HAVE ONLY ONE
LOGICAL NAME. IF MONITOR PRINTS OUT LOGICAL NAME ALREADY
IN USE, DEVICE XXX ASSIGNED, FIRST DEASSIGN OLD NAME
(SAY IT WAS 3) BY TYPING

V14

V14

DEASSIGN 3

FOLLOWED BY:

V14

ASSIGN DSK 3

OTHERWISE YOUR LOGICAL NAME WILL BE FOR A DEVICE YOU DID
NOT INTEND.

3.1.5.5 FINALLY GIVE THE DISK THE LOGICAL NAMES RL4, RL5, RL6, ETC., BY
TYPING:

V14 ,ASSIGN DSK RL4
V14 ,ASSIGN DSK RL5
V14 ,ASSIGN DSK RL6
V14 ETC,

V14 MACRO WILL WRITE THE REL FILES ON DEVICES "RL4", "RL5" AND "RL6".

3.1.5.6 PERFORM THE ASSEMBLIES BY TYPING:

 ,R MACRO<CR>
V14 *SSORL4,CCL0<CR>
 [MACRO TYPES PROGRAM NAMES]
 EXIT [MACRO NOTES TERMINATION]
 ,START<CR>

V14 REPEAT FOR EACH TAPE,

```

V14 3.1.6 FILE S50BTH.CCL PRODUCES BOTH REL (RELOCATABLE BINARY)
V11 FILES AND A CREF INPUT LISTING FILE FOR A 10/50 SYSTEM
V11 USING A 10/40 OR A 10/50 SYSTEM WITH 1 MAGTAPE AND
V14 11 DECTAPES. IF YOU DO NOT HAVE A DISK PROCEED AS FOLLOWS:
V14 .ASSIGN DTA 3
V14 .ASSIGN DTA 4
V14 .ASSIGN DTA 5
V14 .ASSIGN DTA 6
V14 .ASSIGN DTA 14
V14 .ASSIGN DTA 15
V14 .ASSIGN DTA RL4
V14 .ASSIGN DTA RL5
V14 .ASSIGN DTA RL6
V14 .ASSIGN DTA RL14
V14 .ASSIGN DTA RL15
V11 .ASSIGN MTA M [ASSIGN MAGTAPE FOR LISTING]
V14 [MOUNT MONITOR SOURCES 3,4,5,6,14,15 ON LOGICAL UNITS "3","4","5","6","14","15".
V14 MOUNT BLANK DECTAPES IN LOGICAL UNITS "RL4","RL5","RL6","RL14","RL15".
V11 MOUNT A BLANK MAGTAPE WITH THE WHITE RING IN. ON THE
V11 PHYSICAL MAGTAPE THE MONITOR ASSIGNED TO YOU.]
V11 .R PIP
V14 *RL4:=/Z
V14 *RL5:=/Z
V14 *RL6:=/Z [CLEAR THE DIRECTORIES OF UNITS "RL4","RL5",
V14 *RL14:=/Z
V14 *RL15:=/Z
V14 *RL4:=X/B+3IS50BTH.CCL [COPY S50BTH.CCL TO "RL4"]
V11 *CONTROL>C
V11 .R MACRO
V14 *RL4IS50BTH.CCL* [START THE ASSEMBLY PROCESS]
V11 [MACRO WILL TYPE EXIT WHEN IT HAS FINISHED ASSEMBLING AND
V11 LISTING THE ENTIRE MONITOR]
V11 IF YOU DO HAVE A DISK COPY AS MANY OF MONITOR
V11 SOURCES TAPES 1 THROUGH 4 AS WILL FIT ON THE DISK AND
V11 GIVE THE DISK LOGICAL NAMES CORRESPONDING TO THE SOURCE TAPE
V11 NUMBERS RATHER THE DECTAPES AS ABOVE, THE DISK MAY
V11 ALSO BE USED TO RECEIVE THE REL FILES BY TYPING
V11 .ASSIGN DSK RL1
V14 .ASSIGN DSK RL6
V14 .ASSIGN DSK RL14
V14 .ASSIGN DSK RL15

```

3.1.7 ASSEMBLE MONITOR SOURCES BY HAND USING MACRO
[INCLUDED HERE FOR COMPLETENESS ONLY SEE SECTION 3.1.1
THROUGH 3.1.6 FOR AUTOMATIC ASSEMBLY OF ENTIRE MONITOR]

3.1.7.1 DESCRIPTION OF MONITOR SOURCES

THERE ARE OVER 32 MACRO SOURCE FILES TO THE COMPLETE MONITOR. SOME OF THE FILES MAY BE ASSEMBLED BY THEMSELVES WHILE OTHERS MUST BE ASSEMBLED WITH A SYSTEM SYMBOL DEFINITION FILE CALLED S,MAC

WITHIN S, CERTAIN SPECIAL SYMBOLS ARE DEFINED TO HAVE THE VALUE 0 OR -1. THESE VALUES CONTROL THE ASSEMBLY OF CERTAIN FEATURES IN THE MONITOR. THESE SYMBOLS ARE CALLED FEATURE SWITCHES AND ALL BEGIN WITH THE LETTERS FT. IF A SWITCH IS ASSIGNED THE VALUE -1, THE ASSOCIATED FEATURE WILL APPEAR IN THE ASSEMBLY. IF ASSIGNED THE VALUE 0, THE FEATURE WILL NOT APPEAR. SEE LISTING OF S,MAC FOR A DESCRIPTION OF EACH FEATURE.

FILES ASSEMBLED WITH THE VERSION OF S,MAC SUPPLIED WILL CONTAIN THE FULL DUPLEX FEATURE. IN ORDER TO REMOVE THE FULL DUPLEX FEATURE, I.E. PRODUCE A HALF-DUPLEX VERSION OF THE FILES, IT IS NECESSARY TO SET THE SWITCH FTCC=4 THE VALUE OF THE FEATURE SWITCH FTTYSER=0. THIS MAY BE DONE WITH TECO. WHEN ASSEMBLING A HALF DUPLEX LIBRARY, IT IS NECESSARY TO SET THE SWITCH FTCC=0 IN FT5S,MAC IF IT IS REQUIRED IN THE ASSEMBLY OF YOUR PARTICULAR CONFIGURATION.

SOME OF THE FILES MUST BE ASSEMBLED WITH BOTH S AND AN APPROPRIATE FEATURE SYMBOL DEFINITION FILE WHICH CONTROLS CONDITIONAL ASSEMBLY DETERMINED BY WHICH OF THE 3 SYSTEMS IS BEING ASSEMBLED FOR. EACH FILE CONTAINS FEATURE SWITCHES WHICH SPECIFY WHICH OF THE 3 POSSIBLE SYSTEMS ARE TO BE ASSEMBLED. THESE FEATURE SWITCHES ARE IN SEPARATE FILES CALLED:

SYSTEM FILE NAME

V11
V11

400	FT40A,MAC	10/40 NON-DISK
400	FT40D,MAC	10/40 DISK (ALL TYPES)
500	FT50S,MAC	10/50 SWAPPING (ALL DISK TYPES)

(CONT'D)

EXPLANATION OF SYSTEM NAMES:
THE FIRST 2 CHARACTERS SAY WHETHER THE SYSTEM IS NON-
SWAPPING (4) OR SWAPPING (52)
THE THIRD CHARACTER SAYS NON-DISK (N), NON-SWAPPING
DISK (D), SWAPPING (S)

AFTER ASSEMBLING THE REQUIRED SOURCES, THE RELOCATABLE
BINARY(,REL) FILES MUST BE COMBINED INTO A LIBRARY
FILE USING PIP SO THAT THEY MAY BE LOADED USING THE
REGULAR LOADER BEFORE ASSEMBLING THE MONITOR THE USER
MUST DECIDE WHETHER HE WANTS FULL OR HALF DUPLEX TELETYPE
SERVICE, WE RECOMMEND FULL DUPLEX BECAUSE IT ALLOWS CCL
IN DISK SYSTEMS AND HAS MANY USER CONVENIENCES, THE
LIBRARY FILE CANNOT BE MADE TO HANDLE BOTH TYPES TO-
GETHER DEPENDING ON MONGEN ANSWER SO THE DECISION MUST
BE MADE BEFORE ASSEMBLY, THE FOLLOWING INSTRUCTIONS
ARE FOR ASSEMBLING FOR 1 OF 3 LIBRARY FILES:

SYSTEM LIBRARY FILE NAME

V11	4 N	5NXX,REL
V11	4 D	5DXX,REL
V11	5 S	5SXX,REL

(CONT'D)

THE USER MUST DECIDE WHICH OF THE ABOVE THREE FILES HE WISHES TO CREATE IF HE IS CREATING A NEW LIBRARY; OTHERWISE, HE MAY MERELY DETERMINE THE SYSTEM DESIGNATION FOR HIS "EXISTING LIBRARY" FILE FROM THE ABOVE TABLE.

ALTHOUGH IT IS POSSIBLE TO ASSEMBLE, PIP, AND LOAD A MONITOR WITH JUST 2 DECTAPES PLUS A CUSP TAPE THE FOLLOWING DIRECTIONS ASSUME THAT THERE ARE TWO UNITS FOR SOURCES, ONE FOR BINARY, AND ONE SCRATCH TAPE FOR CREF INTERMEDIATE OUTPUT(IF LISTING DESIRED), PLUS THE CUSP TAPE.

MOUNT MONITOR SOURCE TAPE 3 ON UNIT WITH LOGICAL NAME 3 AND MONITOR SOURCE TAPE 4 ON UNIT WITH LOGICAL NAME 4, MOUNT TAPE TO RECEIVE BINARY FILES ON UNIT WITH LOGICAL NAME RL4, IF YOU HAVE A DISK, COPY S,MAC AND FT----,MAC FROM 3 TO DISK USING PIP:

```
.R PIP
*DSK1/X/B+3IS,MAC,FT----,MAC
**C
```

AND IN THE FOLLOWING ASSEMBLY INSTRUCTIONS SUBSTITUTE DSKIS,FT---- FOR 3IS,FT----

DURING THE ASSEMBLIES, SUBSEQUENT SOURCE TAPES 5,6,14, AND 15 WILL BE SUBSTITUTED FOR 4, HOWEVER SOURCE TAPE 3 MUST ALWAYS BE PRESENT UNLESS THE FILES S, AND THE DESIRED FT---- FILES ARE COPIED FROM SOURCE TAPE 3 TO SOURCE TAPE 4, 5, 6, 14, AND 15 OR YOU HAVE A DISK, SINCE THEY ARE RE-READ FOR EACH ASSEMBLY, COPYING ALL OF THE OTHER SOURCES ONTO THE DISK REDUCES THE ASSEMBLY TIME FROM 20 MINUTES TO ABOUT 10 MINUTES ELAPSED TIME, SO IT NEED BE DONE ONLY IF YOU HAVE A LOT OF DISK SPACE, FOR EACH ASSEMBLY, THE USER SHOULD ALTERNATIVELY RUN MACRO AND CREF. OF COURSE IF THE USER DOES NOT WANT A CREF(CROSS-REFERENCE) LISTING, HE NEED ONLY RUN MACRO, HOWEVER, THE INSTRUCTIONS ASSUME THAT A CREF LISTING IS WANTED FOR EACH SUB-PROGRAM OF THE MONITOR, THUS THE PATTERN OF TYPE-IN IS:

(CONT'D)

,R MACRO

*RLA1-----,/C+SIS,FT----,-----

[SOMETIMES S IS OMITTED, MOSTLY
FT---- IS OMITTED] [MACRO PUTS CREF
INTERMEDIATE ON LOGICAL DEVICE DSK
WITH FILE NAME CREF.LST; IF CREF IS
NOT RUN, OMIT /C BUT INCLUDE ","]

THERE ARE NO ERRORS

PROGRAM BREAK IS -----

-K CORE USED

(INSTRUCTIONS ENCLOSED WITHIN < > OMITTED IF NOT RUNNING
CREF)

<
*C

,R CREF

*[USER TYPES JUST CARRIAGE RETURN WHICH CAUSES CREF TO
READ FILE CREF.TMP FROM LOGICAL DEVICE DSK AND PUT CREF
LISTING ON LOGICAL DEVICE LPT]

-K CORE

*C

,R MACRO >

*[NEXT FILE TO BE ASSEMBLED, ETC]

(CONT'D)

THE REASON THAT MACRO AND CREF ARE RUN ALTERNATELY, IS TO REDUCE THE AMOUNT OF CREF INTERMEDIATE STORAGE REQUIRED. IF A USER HAS A MAG-TAPE, HE CAN PUT ALL THE CREF INTERMEDIATE ON MAGTAPE BY RUNNING ALL THE ASSEMBLIES FIRST, FOLLOWED BY ALL THE CREF'S. THIS MAKES FOR MUCH LESS TYPING, SINCE THERE IS NO NEED TO TYPE CONTROL C FOLLOWED BY A MONITOR COMMAND ON EACH ASSEMBLY. WHEN THE CREF'S ARE RUN THE USER MERELY TYPES CARRIAGE RETURN AS INPUT TO EACH ASSEMBLY OUTPUT USING THE MAG TAPE AS INPUT AND LPT AS OUTPUT.

MONITOR COMMANDS:

ASSIGN DTA 3	[SOURCE TAPE 3]
DTAN ASSIGNED	[MONITOR ASSIGNS DTA #N WITH LOGICAL NAME 3]
ASSIGN DTA 4	[SOURCE TAPE 4]
DTAN ASSIGNED	[MONITOR ASSIGNS TAPE WITH LOGICAL NAME 4]
ASSIGN DTA DSK	[MACRO INTERMEDIATE OUTPUT, CREF INPUT]
DTAN ASSIGNED	[MONITOR ASSIGNS DTA WITH LOGICAL NAME DSK]
ASSIGN DTA RL4	[BINARY OUTPUT FROM MACRO]
DTAN ASSIGNED	[MONITOR ASSIGNS TAPE WITH LOGICAL NAME BIN]
,R PIP	[RUN PIP CUSP]
*RL41+/2	[CLEAR DIRECTORY FOR BINARY]
*DSK1+/2	[CLEAR DIRECTORY FOR TMP LISTING (IF NO DISK)]

3.2 MAKE A MONITOR LIBRARY FILE WITH PIP

3.2.1 ORDERING CONSTRAINTS FOR MONITOR LIBRARY FILE AND FOR LOADING

THE ORDERING CONSTRAINTS ON THE MONITOR LIBRARY FILE ARE VERY FEW.

3.2.1.1 COMMON MUST BE LOADED FIRST SINCE IT HAS EXTERNAL STATEMENTS TO LOAD THE DESIRED ROUTINES FROM THE REST OF THE FILE. IT ALSO HAS THE 190 STARTING LOCATIONS IN IT SO IT MUST BE LOADED FIRST. IT SHOULD NOT BE PART OF THE LIBRARY FILE (ALTHOUGH IT WILL DO NO HARM IF IT IS.)
V14 COMMOD SHOULD BE PLACED AFTER COMMON IF IT IS NEEDED,

3.2.1.2 ALL THE REQUIRED AND OPTIONAL ROUTINES MAY BE LOADED IN ANY ORDER.

3.2.1.3 THE LIBRARY MUST END IN THE FOLLOWING ORDER:

3.2.1.3.1 PATCH MUST BE THE FIRST OF THE LAST ROUTINES, BECAUSE IT CONTAINS THE FIRST UNUSED INSTRUCTION IN MONITOR.

3.2.1.3.2 MOVIE MUST BE NEXT

3.2.1.3.3 SYSMAK MUST BE NEXT

3.2.1.3.4 EDDT, IF LOADED, MUST BE NEXT

3.2.1.3.5 ONCE AND REFRESHER MUST FOLLOW EDDT SO THAT IT WILL NOT TAKE UP ANY ROOM WHEN EDDT IS DESIRED TO BE AVAILABLE FOR EXEC MODE DEBUGGING (ONCE ONLY DIALOG QUESTION).
V14 THIS REQUIRES ONCMOD
V14 REFSTR
V14 ONCE IN THAT ORDER.
V15 IF ONCE IS NOT LAST, THE MONITOR WILL PROBABLY HALT
V15 AFTER DESTROYING THE PROGRAM LOADED AFTER ONCE.

3.2.1.5 KNOWING WHAT THE ORDERING CONSTRAINTS ARE YOU WILL HAVE AN OPPORTUNITY TO DISCOVER SHORT CUTS TO THE ABOVE PROCEDURES. FOR EXAMPLE, IT IS POSSIBLE TO KEEP YOUR OLD LIBRARY FILE AND LOAD A FEW ADDITIONAL AND/OR REPLACEMENT ROUTINES FIRST, SINCE THE GLOBAL REQUESTS WILL BE SATISFIED THE LOADER WILL NOT LOAD THE OLDER LIBRARY ROUTINE, OF COURSE SINCE COMMON MUST BE THE VERY FIRST LOADED ROUTINE, IT MUST PRECEDE ANY OF YOUR ADDITIONAL AND/OR REPLACEMENT ROUTINES.

3.2.2 NOW THAT YOU HAVE CREATED ALL OF THE RELOCATABLE BINARY FILES WITH THE ASSEMBLER, YOU SHOULD COMBINE THEM INTO A MONITOR LIBRARY FILE BN##,REL FOR 10/40 SYSTEM AND SS##,REL FOR A 10/50 SYSTEM,

3.2.3 ASSUMING THAT THE BINARIES ARE STILL ON LOGICAL DEVICES RL4, RL5, RL6, RL14 AND RL15. IF LOGICAL DEVICES RL4, RL5, RL6, RL14 AND RL15 ARE THE SAME DEVICE, SAY DSK AND IF MAKING A 10/40 LIBRARY FILE, TYPE:

FOR 10/40 SYSTEMS: (ALL RELS ON DISK):

```
.R PIP
*DSK:LAST/B*DSK:PATCH,LAS,MOVIE,LAS,SYSMAX,LAS,EDDT,LAS,ONCE,LAS
*DSK:BN##,REL/B*DSK:*,REL,DSK:LAST
*DSK:*,REL/R*,PIR
```

IF LOGICAL DEVICES RL4, RL5, RL6, RL14 AND RL15 ARE THE SAME DEVICE SAY DSK AND IF MAKING A 10/50 LIBRARY FILE TYPE:

FOR 10/50 SYSTEMS: (ALL RELS ON DISK):

```
.R PIP
*DSK:LAST/B*DSK:PATCH,LAS,MOVIE,LAS,SYSMAX,LAS,EDDT,LAS,ONCMOD,LAS,REFSTR,LAS,ONCE,LAS
*DSK:BN##,REL/B*DSK:*,REL,DSK:LAST
*DSK:*,REL/R*,PIR
```

IF LOGICAL DEVICES RL4, RL5, RL6, RL14 AND RL15 ARE DIFFERENT DEVICES, AND IF MAKING A 10/40 LIBRARY FILE, TYPE:

FOR 10/40 SYSTEMS (RELS ON DECTAPE):

```
.R PIP
*RL4:LAST/B*RL5:PATCH,LAS,MOVIE,LAS,RL6:SYSMAX,LAS,RL5:EDDT,LAS,ONCE,LAS
*RL4:BN##,REL/B*RL4:*,REL,RL5:*,REL,RL6:*,REL,RL14:*,REL,RL15:*,REL,RL4:LAST
```

IF LOGICAL DEVICES RL4, RL5, RL6, RL14 AND RL15 ARE DIFFERENT, AND IF MAKING A 10/50 LIBRARY FILE, TYPE:

FOR 10/50 SYSTEMS (RELS ON DECTAPE):

```
.R PIP
*RL4:LAST/B*RL5:PATCH,LAS,MOVIE,LAS,RL6:SYSMAX,LAS,RL5:EDDT,LAS,RL14:ONCMOD,LAS,REFSTR,LAS,RL15:ONCE,LAS
*RL4:BN##,REL/B*RL4:*,REL,RL5:*,REL,RL6:*,REL,RL14:*,REL,RL15:*,REL,RL4:LAST
```

WHERE THE /B SAYS COPY BINARY (WHICH THIS IS) AND THE *,REL SAYS COPY ALL REL FILES. FILES PATCH,LAS, MOVIE,LAS SYSMAX,LAS,EDDT,LAS,ONCMOD,LAS,REFSTR,LAS AND ONCE,LAS MUST BE LAST AND IN THAT ORDER. ALL OF THE OTHER FILES MAY BE IN ANY ORDER. HOWEVER THEY HAVE BEEN ARRANGED ALPHABETICALLY.

- 3.3 LOAD MONITOR USING LOADER
TO LOAD THE MONITOR FOLLOW SECTIONS 2.3.1, THROUGH 2.3.4.
- 3.4 SAVE MONITOR USING MONITOR SAVE COMMAND
 - 3.4.1 TYPE
SAVE DTAL XXXMON
WHERE XXXMON IS THE NAME OF YOUR MONITOR.

- 4. PATCHING YOUR MONITOR WITH DDT
 - 4.0 PATCHING COMPONENTS
 - 4.1 PATCHING WITH USER DDT UNDER TIMESHARING
 - 4.2 PATCHING WITH EXEC DDT STAND-ALONE
 - 4.3 PATCHING CONVENTIONS (EITHER DDT),
- 4.0 REQUIRED COMPONENTS
 - 4.0.1 FOR PATCHING WITH USER DDT UNDER TIMESHARING
 - 4.0.1.1 MONITOR ON DECTAPE WHICH WAS LOADED WITH USER DDT (/D SWITCH TYPED TO LOADER,)
 - V14 4.0.1.2 UP TO 38K OF USER CORE AVAILABLE TO A SINGLE USER UNDER TIMESHARING
 - 4.0.1.3 A RUNNING TIME SHARING MONITOR
 - 4.0.2 FOR PATCHING WITH EXEC DDT OUT OF TIME SHARING
 - 4.0.2.1 MONITOR ON DECTAPE WHICH WAS LOADED WITH EXEC DDT (ANSWER Y TO MONGEN DIALOG)
 - 4.0.2.2 JUST ENOUGH PHYSICAL CORE TO LOAD MONITOR. THIS TAKES LESS CORE THAN PATCHING WITH USER DDT BUT MACHINE CANNOT BE TIMESHARED,

4.1 PATCHING WITH USER DDT UNDER TIME SHARING.

4.1.1 USER DDT IS RECOMMENDED FOR PATCHING OVER EXEC DDT
SINCE MACHINE MAY BE TIME SHARED DURING PATCHING PROCESS.
(NOTE A COPY OF THE MONITOR IS PATCHED, NOT THE ONE
CONTROLLING THE MACHINE.) HOWEVER IT REQUIRES MORE
CORE ON YOUR SYSTEM THAN DOES PATCHING WITH EXEC DDT.
V14 THERE MUST BE AVAILABLE UP TO 38K OF USER CORE
AVAILABLE TO A SINGLE JOB UNDER TIME SHARING IN ORDER
TO MAKE THE PATCHES WITH USER DDT. IN ORDER TO HAVE
LOADED USER DDT WITH YOUR MONITOR YOU MUST HAVE USED THE
/D SWITCH. IF YOU DID NOT, YOU MUST RELOAD YOUR MONITOR.
YOU DO NOT NEED TO GO THROUGH THE MONGEN DIALOGUE AGAIN.
HOWEVER, BE SURE TO ALSO SPECIFY THE /S SWITCH SO THAT
LOCAL SYMBOLS ARE LOADED. PATCHING WITH-OUT LOCAL
SYMBOLS IS NOT RECOMMENDED.

4.1.2 GET COPY OF YOUR MONITOR BY TYPING:

V14 GET DTAN 5S45A

TO THE RUNNING TIME SHARING SYSTEM. WHEN THE MONITOR
RESPONDS WITH:

JOB SETUP

.

TYPE:

DDT

WHICH WILL START UP USER DDT.

- 4.1.3 AFTER ALL PATCHES ARE MADE, TYPE <CONTROL>C,
FOLLOWED BY I

V14

SAVE UTAN 5540B

BE CAREFUL NOT TO TYPE <CONTROL>C TWICE, LEAST YOU RETURN
TO MONITOR MODE BEFORE DDT MIGHT MAKE ITS LAST
MODIFICATION (SWAPPING SYSTEMS ONLY).

V14

- 4.1.4 YOU MAY SAVE THE PATCHED MONITOR ON THE DISK TOO, SINCE
THE FORMATS ARE THE SAME IN THE 5 SERIES MONITOR.
BE SURE TO WRITE MONITOR ON DECTAPE USING MONITOR SAVE
COMMAND RATHER THAN COPYING IT WITH PIP, SINCE THIS
SAVED FILE MUST BE LOADED WITH TENDMP, ALL SAVED FILES
WHICH WILL NEVER BE LOADED BY TENDMP MAY BE COPIED BY
PIP (USING /B SWITCH OF COURSE).

4.2

PATCHING WITH EXEC DDT STAND-ALONE

- 4.2.1 EXEC DDT IS RECOMMENDED ONLY IF YOU DO NOT HAVE ENOUGH
CORE FOR PATCHING WITH USER DDT, IT IS ALSO RECOMMENDED
THAT ALL PATCHES BE MADE WITH EITHER ONE OR THE OTHER
BUT NOT BOTH, THIS IS BECAUSE THE SYMBOL TABLE POINTER
BECOMES CONFUSED AND TENDMP WRITES BLOCKS CONSECUTIVELY
WHICH CAUSES THE TAPE TO ROCK ON A MONITOR GET FOR EACH
BLOCK, HOWEVER, SWITCHING CAN BE DONE IF THESE RESTRICTIONS
ARE OBSERVED.

- 4.2.2 IF THE MONITOR TO BE PATCHED WAS PREVIOUSLY PATCHED BY
EXEC DDT, THEN PATCHED BY USER DDT, ONE SPECIAL ACTION
MUST BE TAKEN BEFORE EXEC DDT WILL BE ABLE TO REFERENCE
THE MONITOR SYMBOL TABLE: THE CONTENTS OF ABSOLUTE
LOCATION 116(JOBSYM) MUST BE PLACED IN ABSOLUTE LOCATION
36(DDTSYM) (THE PLACE WHERE DDT EXPECTS TO FIND ITS SYMBOL
TABLE POINTER). THIS IS CONVENIENTLY ACCOMPLISHED WITH
THE FOLLOWING COMMAND TO EXEC DDT.

MOVE 116\$X
MOVEM 36\$X

NOTE: THE FIRST TIME CONTROL WENT TO 141, C(116) IS
COPIED TO 36, THEN THE COPY CODE IS OVER WRITTEN.

4.2.3 LOAD THE MONITOR FROM DECTAPE WITH TENDMP, WITHOUT
STARTING BY TYPING!
LS5S42A SAV

V14

FOLLOWED BY CARRIAGE RETURN TO TENDMP.
THEN SPECIFY EXEC DDY STARTING ADDRESS AND START
IT UP BY TYPING!

141S
GS

4.2.4 WHEN YOU ARE FINISHED PATCHING, TYPE!

774205G

TO RETURN TO 32K TENDMP (37400 IF 16K, 137400 IF 48K,
ETC.),

4.2.5 SAVE (DUMP) THE MONITOR ON DECTAPE BY TYPING!

V13
V14

140S
DS5S42S SAV

FOLLOWED BY CARRIAGE RETURN TO TENDMP.
WARNING - DO NOT TYPE A PERIOD BETWEEN NAME AND EXTEN-
SION, BECAUSE TENDMP WILL MAKE IT BE A PART OF NAME, AND
MONITOR AND CUSPS WILL NOT BE ABLE TO GET FILE.

4.3 PATCHING CORRECTIONS (EITHER DDT)

THE FOLLOWING TECHNIQUES FOR MONITOR PATCHING ARE PART CONVENTION AND PART NECESSITY; IT IS WELL TO FOLLOW THEM CAREFULLY,

- 4.3.1 EXEC DDT BEHAVES ALMOST EXACTLY LIKE USER DDT AS DESCRIBED IN THE DDT MANUAL (DEC-10-CODA-0). THE USER SHOULD BE THOROUGHLY FAMILIAR WITH THIS DOCUMENT BEFORE TRYING TO USE EXEC DDT. EXEC DDT IS ENTERED BY STARTING THE MACHINE AT, OR TRANSFERRING TO, ABSOLUTE LOCATION 141 IN ALL MONITORS. THIS MAY BE ACCOMPLISHED THROUGH COMMANDS TO TENDMP OR BY MEANS OF THE CONSOLE SWITCHES.
- 4.3.2 ALWAYS PATCH A FRESHLY LOADED COPY OF THE MONITOR-ONE WHICH HAS NOT YET RUN THROUGH THE INITIALIZATION DIALOGUE.
- 4.3.3 LOADED INTO EACH MONITOR IS A BLOCK OF PATCHING SPACE BEGINNING AT GLOBAL LOCATION PATCH. BY CONVENTION, THE VALUE OF THIS SYMBOL IS NOT CHANGED WHEN PATCHES ARE MADE; INSTEAD, ANOTHER SYMBOL, PAT, IS REDEFINED BY THE USER AFTER EACH PATCH SO AS TO POINT AT ALL TIMES TO THE NEXT FREE LOCATION IN THE PATCHING AREA. THUS, THE VERY FIRST PATCH IN ANY SYSTEM WILL BEGIN AT SYMBOLIC LOCATION PATCH; ALL SUBSEQUENT PATCHES WILL BE MADE STARTING AT SYMBOLIC LOCATION PAT, BUT THIS SYMBOL WILL BE CHANGED TO POINT TO THE NEXT FREE LOCATION AS THE LAST STEP IN MAKING ANY GIVEN PATCH. BY THIS MEANS, THE NEXT PERSON TO PATCH THE MONITOR WILL BE ABLE TO FIND THE PATCHING SPACE.
- 4.3.4 SUGGESTED PATCHES ARE DISTRIBUTED IN A NOTATION CONSISTENT WITH THE ABOVE MECHANISM. EVERYTHING THE USER MUST TYPE TO EXEC DDT IS INCLUDED IN THE SUGGESTED PATCH INCLUDING THE DDT COMMAND WHICH UNLOCKS THE PROPER SET OF LOCAL SYMBOLS.
- 4.3.5 THE TIME SHARING MONITORS BEGIN TO ALLOCATE FREE CORE FOR VARIOUS INTERNAL FUNCTIONS JUST ABOVE THE LAST PATCH LOCATION IN USE. FOR THIS REASON IT IS VERY IMPORTANT THAT, AS A LAST STEP IN ANY PATCHING SESSION, THE USER INFORM THE MONITOR OF HOW MUCH ADDITIONAL PATCH SPACE WAS USED. OTHERWISE, THIS SPACE WILL BE ALLOCATED AND THE PATCHES WILL BE DESTROYED. THE USER SHOULD HAVE REDEFINED LOCATION PAT AS THE FIRST FREE LOCATION; THIS HAVING BEEN DONE, IT IS ONLY NECESSARY TO OPEN LOCATION PATSIZE (LOCATION ONCE+1 IN OLDER MONITORS) AND RETYPE ITS CONTENTS AS

MOVEI TAC,PAT

(4.3 CONT'D)

V14 4.3.6 IT IS CONSIDERED GOOD PRACTICE TO CHANGE THE NAME OF A
V14 EVERY TIME IT IS PATCHED, FOR EXAMPLE, 5.18A MIGHT
V14 BECOME 5.18B WHEN PATCHED FOR THE SECOND TIME. IF ALL
APPLICABLE DEC-RELEASED PATCHES THROUGH LEVEL X HAVE
BEEN APPLIED, THEN IT IS OUR CONVENTION TO NAME THE FIELD
V14 IMAGE MONITOR 5.18X. THE NEW NAME SHOULD BE ENTERED AS
7 BIT ASCII TEXT IN LOCATION CONFIG (AND THE SEVERAL
LOCATIONS WHICH FOLLOW - UP TO 24 CHARACTERS).

NOTE: IF THE NAME IS A MULTIPLE OF 5 CHARACTERS LONG,
MAKE SURE THE NEXT WORD CONTAINS A ZERO TO DELIMIT THE
TEXT STRING. LIKEWISE, THE SYSTEM DATE IN LOCATION
SYSDAT AND SYSDAT+1 SHOULD BE UPDATED (IN 7 BIT ASCII TEXT).

4.3.7 NEVER SAVE A MONITOR WHICH HAS ALREADY BEEN RUN, AS IT
WILL BE USELESS FOR RELOADING. IF THE SYSTEM IS ACCIDENTLY
RUN BEFORE SAVED, START AGAIN WITH A FRESH COPY AND
REMAKE THE PATCHES.

4.3.8 INSTRUCTIONS AND AN EXAMPLE FOR PATCHING THE MONITOR,
THE TIME TO MAKE PATCHES IS AFTER THE MONITOR HAS
BEEN LOADED BUT BEFORE IT HAS BEEN RUN. IN ORDER TO PATCH,
IT IS NECESSARY TO HAVE A COPY OF EXEC MODE DDT LOADED
WITH THE MONITOR. IF YOUR SAVED VERSION OF THE
MONITOR DOES NOT CONTAIN DDT, YOU MUST REPEAT THE MONGEN
DIALOG AND RELOAD YOUR MONITOR AND ANSWER YES TO THE
QUESTIONS
LOAD EXEC DDT?
AND
LOCAL SYMBOLES?
SINCE BOTH ARE NECESSARY FOR PATCHING THE MONITOR, IT IS
POSSIBLE TO PATCH WITHOUT LOCAL SYMBOLS, BUT IT IS NOT
RECOMMENDED. DISTRIBUTED PATCHED WILL ASSUME LOCAL SYMBOLS.

(4.3.9 CONT'D)

THE PATCHES THEMSELVES ARE GIVEN IN THE FORMAT OF DDT TELETYPE DIALOGUE. THE LOCATIONS ARE RENAMED BY THEIR SYMBOL NAMES. IF A USER DOES NOT HAVE LOCAL SYMBOLS LOADED, HE SHOULD REFER TO HIS MONITOR STORAGE MAP AND LISTING TO TRANSLATE LOCAL SYMBOLS TO GLOBAL SYMBOLS AND LITERALS. THE FIRST COMMAND IN EACH GROUP IS THE COMMAND TO UNLOCK THE LOCAL SYMBOL TABLE IN THE NAMED ROUTINE.

NOTE: \$ IN THIS SECTION STANDS FOR THE ALTMODE KEY
 EX: USER TYPES CDRSR63: TTY OUTPUT TAB AND
 DDT NOW MAY REFERENCE
 THE SYMBOL TABLE OF THE
 ROUTINE CDRSR6.

AT THE END OF THE MONITOR IS A SPACE OF ABOUT 300(8) LOCATIONS WHICH IS RESERVED FOR MONITOR PATCHES. THIS PATCH BUFFER BEGINS AT GLOBAL LOCATIONS PATCH. TO INSERT A PATCH WITHIN A MONITOR ROUTINE, THE PROCESS IS TO BEGIN AND THEN TO WRITE THE PATCH BEGINNING AT LOCATION PATCH. THE LAST INSTRUCTION IN THE PATCH SHOULD BE A JRST BACK TO THE MONITOR.

EX:	IN THE ROUTINE BAH YOU WOULD LIKE TO CHANGE FROM
BAH2:	JFCL BAH2: JFCL
	HRRS 0,0 TO ADDI 0,0
	FMRR 1,1 HRRS 0,0
	FMRR 1,1

IN DDT YOU WOULD GIVE THE COMMAND

BAHS: WHICH UNLOCKS THE LOCAL SYMBOLS IN BAH

THEN TYPE

BAH2+1/ WHICH OPENS AND TYPES OUT THE CONTENTS OF BAH2+1

THE TTY THEN OUTPUTS

(TAB) HRRS 0,2 (TAB)
 YOU WOULD THEN TYPE IN

JRST PATCH(TAB) THE TAB CLOSSES THE LOCATION BAH2+1
 WHICH IS NOW MODIFIED AND OPENS LOCATION PATCH

(4,3,8 CONT'D)

TTY RESPONSE IS
PATCH/ (TAB)0(TAB)
YOU THEN INSERT

ADDI 0,0(LINE FEED)

LINE FEED CLOSES THE LOCATION
AND OPENS THE NEXT ONE

TTY OUTPUTS
PATCH+1/(TAB)0(TAB)

YOU INSERT
HRRS 0,0(LINE FEED)

TTY OUTPUTS
PATCH+2/(TAB)0(TAB)

YOU INSERT
JRST BAH2+2(LINE FEED)

TTY OUTPUTS
PATCH+3/(TAB)0(TAB)

YOU INSERT

PAT: (CARRIAGE RETURN)
(THIS RENAMES THE CURRENT LOCATION WITH
GLOBAL SYMBOL PAT)

THE ENTIRE DIALOGUE WOULD LOOK LIKE THE FOLLOWING:

BAH1 BAH2+1/	HRRS 0,0	JRST PATCH
PATCH/ 0	ADDI 0,0	
PATCH+1/ 0	HRRS 0,0	
PATCH+2/ 0	JRST BAH2+2	
PATCH+3/ 0	PAT:	

THIS LAST STEP IS QUITE IMPORTANT. THE GLOBAL PATCH
ALWAYS POINTS TO THE BEGINNING OF THE PATCH AREA. ONLY
THE FIRST PATCH IN THIS AREA WILL BEGIN AT LOCATION
PATCH. AFTER EACH PATCH IS MADE, THE FIRST UNUSED LOCATION
SHOULD BE RENAMED PAT. THIS IS NECESSARY TO DETERMINE
WHERE SUCCESSIVE PATCHES SHOULD BEGIN.

(4.3.8 CONT'D)

WHEN THE PATCHING SESSION IS COMPLETE, THE GLOBAL LOCATION
PATSIZ SHOULD THEN BE OPENED AND SHOULD BE ALTERED THUS

PATSIZ/ MOVEI X,Y MOVEI YAC,PAT

THIS INFORMS THE MONITOR WHERE THE CURRENT END OF THE
PATCHES IS. A COMMON ERROR TO FORGET THIS STEP, WHICH
WILL CAUSE THE MONITOR TO LOOP WHEN STARTED UP INSTEAD
OF RUNNING THE NULL JOB. THIS IS BECAUSE THE MONITOR
WILL HAVE CREATED COPIES OF MULTIPLE DEVICE DATA BLOCKS
ON TOP OF YOUR PATCH. IN ADDITION, THE GLOBAL LOCATIONS
CONFIG AND SYSDAT SHOULD BE UPDATED TO IDENTIFY THE NEW
MONITOR VERSION AND DATE OF UPDATE.

V14 EXI CONFIG\$7T/ 5270 "/527E/

\$7T IS A COMMAND TO PRINT THE CONTENTS OF THE
PRECEDING ADDRESS AS A 7 BIT ASCII CHARACTER.

" MEANS INSERT THE ASCII TEXT FOLLOWING THE /
IN THE CURRENT OPENED LOCATIONS TERMINATING THE
TEXT WITH THE SECOND /.

V14 ALSO SYSDAT\$7T/ 01-01 "/04-31/
V14 SYSDAT+1\$7T/ -64 "/-70/

THIS ALSO COMPLETES THE PATCHING PROCESS. AT THIS POINT
THE MONITOR IS READY TO RUN. IT SHOULD NOT BE STARTED,
HOWEVER, UNTIL A COPY WITH THE PATCHES IS SAVED ON A DEC TAPE
FOR FUTURE RELOADING.

AS AN AID TO PATCHING, IN THE DISTRIBUTED PATCH RELEASES,
USER INPUTS TO THE TTY ARE IN LOWER CASE; DOT OUTPUT IS
IN UPPER CASE.

6. CRASH PROCEDURES IN MONITOR 55,01

V10 THERE IS A NEW, EASIER CRASH PROCEDURE IN MONITOR 55,01. IT IS
V10 DOCUMENTED IN MONCSP,MAN BUT MANY PEOPLE HAVE NOT SEEN IT. IT
V10 IS IMPERATIVE THAT CRASHES BE TAKEN CORRECTLY, ESPECIALLY NOW
V10 THAT CRASHES ARE OCCURRING SO INFREQUENTLY. THE NEW PROCEDURE
V10 SAVES THE HARDWARE STATE OF THE MACHINE, INCLUDING PC, ALL IO
V10 DEVICE STATUS AND AC'S,

V16 A. FILL OUT A SOFTWARE ERROR REPORT FORM(SER). SEE ERROR,FRM
V16 DISTRIBUTED AS A SOURCE FILE,

- V16 1. FIND FIRST EMPTY FORM IN SOFTWARE LOGBOOK AND
V16 FILL OUT NEXT HIGHEST SER NUMBER WHERE IT SAYS "ERROR NO,"
V16 2. FILL OUT MONITOR VERSION, PATCH LEVEL, DATE, TIME, AND WHO,
V16 3. WRITE DOWN PC, MA, INSTR, REG., AND PI IN PROGRESS
V16 IN BALNKS PROVIDED.
V16 4. CHECK BOX FOR REASON FOR CRASH, IE HALT, NXH, LOOP, HUNG,
V16 CUSP, OTHER

V10 B. FIND CURRENT USER JOB NUMBER IF NOT ZERO,

- V10 1. IF SWITCHES ARE NOT SET TO 150 (LOCATION JOB)
V10 SET THEM TO 150 AND PUSH EXAMINE,
V10 2. CONVERT OCTAL LIGHTS TO DECIMAL
V10 3. SHOUT WHO IS JOB #N?, WHERE N IS THE DECIMAL NUMBER,
V10 (IF 0 DO NOT BOTHER, NULL JOB WAS RUNNING)
V10 4. GO TO THAT USER'S TELETYPE AND COLLECT HIS OUTPUT. DO
V10 THIS QUICKLY AS USER'S TEND TO CLEAN UP WHEN SYSTEM
V10 CRASHES, THEREBY DESTROYING USEFUL INFORMATION,

V10 C. SET MONITOR TO TAKE AUTOMATIC DUMP

- V10 1. SET ADDRESS SWITCHES TO 30
V10 2. PUSH EXAMINE THIS TO MAKE SURE 30 WAS 0,
V10 3. CHECK MEMORY ADDRESS LIGHTS TO MAKE SURE 30 APPEARS THERE,
V10 (MAYBE NOT IF INTERMITTENT CONTACT OF CONSOLE SWITCHES)
V10 4. SET ONE OR MORE DATA SWITCHES TO NON-ZERO,
V10 5. PUSH DEPOSIT "THIS",
V16 6. PUSH "CONT". MONITOR SHOULD HALT WITH PC=10,

6.1 SAVE CRASHED MONITOR ON DISK WITH BOOTS

V16 THERE ARE MANY ADVANTAGES TO SAVING CRASHED MONITORS ON DISK RATHER
V16 THAN DECTAPE,

V16 A. FASTER

V16 B. SAVE ALL JOB DATA AREAS IF MACHINE HAS MORE THAN
V16 64K OF CORE

V16 THE ONLY DISADVANTAGE IS THAT THE SPACE FOR CRASH.SAV MUST BE
V16 PREALLOCATED. THE ONCE ONLY DIALOG ASKS THE NUMBER OF K TO
V16 BE ALLOCATED TO CRASH.SAV ON EACH FILE STRUCTURE. IF YOU HAVE
V16 A SMALL DISK, YOU WILL PROBABLY CHOOSE TO USE TENDMP TO SAVE
V16 CRASH AND RELOAD MONITOR (SEE 6.2 BELOW).

V16 D. LOAD PAPER TAPE BOOTS ASSEMBLED FOR BIGGEST SIZE OF MEMORY
V16 (NO LIMIT) SO THAT ALL OF MEMORY WILL BE DUMPED,

- V16 1. SET READ IN DEVICE SWITCHES TO 104 (BITS 5 AND 7 DOWN)
V16 2. PUT BOOTS IN PAPER TAPE READER
V16 3. PUSH STOP, RESET READIN (PAPER TAPE WILL READ-IN)

V16 E. DUMP CORE ON DISK

V16 1. TYPE: DSKBI/D

V16 FOLLOWED BY CARRIAGE RETURN, WHERE DSKBI CONTAINS A
V16 CRASH.SAV ON [1,4] WHICH IS BIG ENOUGH TO HOLD ALL OF CORE.
V16 IF BOOTS RESPONDS WITH A CLICK IMMEDIATELY, IT MAY BE THAT
V16 CRASH.SAV WAS MISTAKENLY ASSIGNED 0 K WHEN FILE STRUCTURE
V16 WAS DEFINED, OR FILE STRUCTURE WAS SPECIFIED WHICH
V16 HAS A CRASH.SAV WITH 0K,

V16 F. RELOAD MONITOR - DO NOT RESTART

- V16 1. TYPE JUST CARRIAGE RETURN TO BOOTS. BOOTS WILL LOAD SYSTEM.SAV
V16 FROM SYS,

(6. CONT'D)

6.2 SAVE CRASHED MONITOR ON DECTAPE WITH TENDMP

V10 D. LOAD PAPER TAPE TENDMP ASSEMBLED FOR BIGGEST SIZE OF MEMORY
V10 (UP TO 64K IF YOU HAVE 64K OF MEMORY) SO DUMP ALL OF CORE,

V10 1. SET READ IN DEVICE SWITCHES TO 104 (BITS 5 AND 9 DOWN),
V10 2. PUT TENDMP IN PAPER TAPE READER
V10 3. PUSH STOP, RESET, READIN (PAPER TAPE WILL READIN),

V10 E. DUMP CORE ON DECTAPE

V10 1. MOUNT DECTAPE ON ANY CONVENIENT UNIT, SAY N,
V10 2. SET WRITE ENABLED,
V10 3. TYPE NS (WHERE S = ALT-MODE), TAPE N WILL SPIN,
V10 4. TYPE ZS (WHICH ZERO'S TAPE),
V10 5. TYPE DSCRASH SAV FOLLOWED BY CARRIAGE RETURN, TENDMP
V10 WILL WRITE ALL OF CORE ONTO DECTAPE.

V10 F. LABEL TAPE

V10 1. REMOVE TAPE FROM REEL AND MARK REEL # ON CRASH FORM,
V10 2. PUT LABEL ON TAPE CONTAINING MONITOR NAME, DATE, AND
V10 CRASH SAV,
V16 3. PUT TAPE IN CRASH RACK,

V16 6.3 COPY CRASH FROM DECTAPE TO DISK AND EXPAND,

V10 1. LOGIN UNDER 1,2
V10 2. MOUNT MONITOR CRASH PROGRAMS ON DECTAPE, IF FILEX,
V14 FILODT.TXT, FDSS01.SAV ARE NOT ON CUSP, AND ASSIGN DECTAPE
V10 (SAY DTAN), (SEE MONCSP.MAN IF YOU HAVE NOT MADE A
V14 FDSS01.SAV FOR YOUR SYSTEM),
V10 3. ASSIGN DECTAPE (SAY DTAX) CONTAINING CRASH.SAV
V10 4. TYPE R FILEX OR RUN DTAN FILEX,

V16 *SYS:SER###,XPN/E/Q-DTAX:CRASH.SAV

V16 -
V16 WHERE ### IS THE SOFTWARE ERROR NUMBER OF THIS CRASH,

V16 6.4 IF CRASH WAS DUMPED ON DISK WITH BOOTS ON SYSCRASH,SAV
V16 EXPAND USING FILEX;
V16 *SYS:SER###,XPN<055>/E+DSK8:CRASH,SAV[1,4]
V16 -
V16 WHERE ### IS THE SOFTWARE ERROR NUMBER OF THIS CRASH,
V10 I. PRODUCE FILDDT SYMBOLIC OUTPUT OF CRASH
V16 1. TYPE:
V14 ASSIGN DTAN SYS IF FD5S01 NOT ON CUSP.
V14 2. TYPE ASSIGN DSK LPT (SO THAT FD5S01 WILL WRITE FILE
V10 SNAP,LST ON DSK),
V14 3. TYPE R FD5S01,
V14 4. FD5S01 WILL COMPUTE FOR 14 TO 18 MINUTES, SEE WHEN DONE,
V16 YOU MAY TYPE ONE <CONTROL>C AHEAD WHILE IT IS COMPUTING
V16 AND TYPE AHEAD ANOTHER COMMAND OR TWO, SUCH AS:
V16 .LIST SNAP,LST
V10 6. PUT LINE PRINTER LISTING UNDER WHITE BOX,

V16 END OF "MONITR,OPR"

8. SYSTAT MONITOR COMMAND

8.1 THE MONITOR COMMAND SYSTAT CAUSES A CUSP TO BE RUN WHICH PRINTS STATUS INFORMATION ABOUT THE SYSTEM. IT MAY EVEN BE TYPED WHEN THE USER IS NOT LOGGED-IN, THUS ALLOWING THE USER TO DETERMINE THE LOAD ON THE SYSTEM BEFORE LOGGING-IN. SOME INSTALLATIONS MAY CONSIDER THE SYSTAT INFORMATION PROPRIETARY, IN WHICH CASE THEY SHOULD CHANGE THE PROTECTION OF THE SAVE FILE (SYSTAT.SAV) ACCORDINGLY, SO THAT ONLY OPERATIONS PEOPLE MAY USE IT.

TO DIVERT THE SYSTAT OUTPUT TO THE LINE PRINTER, ASSIGN THE LPT AND GIVE IT LOGICAL NAME SYSTAT, TO WRITE THE OUTPUT ON THE DISK AS A FILE WITH NAME SYSTAT.TXT, ASSIGN DEVICE DSK AND GIVE IT LOGICAL NAME SYSTAT.

THE BEST WAY TO DESCRIBE THE SYSTAT OUTPUT IS WITH AN EXAMPLE:

Status of 5S.0016 LEVEL D at 11:59:11 on 08-May-70

Uptime 01:19:07, 7% Null time = Idle+Lost = 1% + 6%

System File Structures:

DSKA,DSKB,DSKC,

TITLE LINE - THE NAME OF SYSTEM AS SPECIFIED IN MONGEN DIALOG
QUESTION AND PATCHED AS ASCII TEXT IN LOCATIONS CONFIG...
CONFIG+4, FOLLOWED BY THE TIME OF DAY AND THE DATE.

CPU USAGE - THE NUMBER OF HOURS, MINUTES, AND SECONDS SINCE
SYSTEM WAS LOADED INTO CORE. 140 AND 143 RESTARTS DO NOT RESET THIS
QUANTITY TO ZERO. THE PERCENT OF UP TIME THAT SYSTEM WAS RUNNING THE
NULL JOB. NULL TIME IS DIVIDED INTO TWO CATEGORIES, IDLE
AND LOST. THE IDLE TIME IS THE PERCENT OF UPTIME THAT NO JOB
WANTED TO RUN, I.E., ALL JOBS WERE HALTED OR WERE IN A WAIT FOR
SOME DEVICE. THE LOST TIME IS THE PERCENT OF UPTIME THAT THE NULL
JOB WAS RUNNING BUT AT LEAST ONE OTHER JOB WANTED TO RUN (I.E.,
WAS NOT WAITING FOR A DEVICE) BUT COULD NOT BE RUN BECAUSE OF ONE
OF THE FOLLOWING CAUSES:

1. BEING SWAPPED OUT
2. BEING SWAPPED IN
3. ON DISK WAITING TO BE SWAPPED IN
4. MOMENTARILY STOPPED SO DEVICES CAN BECOME INACTIVE
IN ORDER TO SHUFFLE JOB IN CORE.

IN A SENSE THE IDLE TIME RATHER THAN ALL OF NULL TIME
REPRESENTS THE EXCESS CAPACITY OF THE SYSTEM WHICH CAN BE
ABSORBED BY ADDING MORE USERS. THE LOST TIME CANNOT BE USED
UNLESS THE JOB MIX IS CHANGED..

(8.1 CONT'D)

JOB DESCRIPTION:

EACH JOB WHICH IS LOGGED-IN HAS THE FOLLOWING INFORMATION
TYPED ABOUT ITSELF:

1. JOB NUMBER (JOB)
 - 1A. IF THE JOB HAS A HIGH SEGMENT WHICH HAS BEEN SUPERCEDED, AN EACH SIGN (*) IS PRINTED AFTER THE JOB NUMBER.
 - 1B. IF THE JOB IS USING A HIGH SEGMENT WHICH IS FROM A DIRECTORY OR DEVICE OTHER THAN THE CUSP DIRECTORY ON DEVICE SYS, A NUMBER SIGN (#) IS PRINTED AFTER THE JOB NUMBER.
2. PROJECT-PROGRAMMER NUMBER OF THE USER (WHO). IF THE USER HAS DETACHED HIS TTY FROM THE JOB, **,** IS PRINTED INSTEAD SO THAT ANOTHER USER CANNOT ATTACH TO THE DETACHED JOB. FOR THE OPERATOR AND THE USER HIMSELF, THE NUMBER IS PRINTED.
3. TELETYPE NUMBER (WHERE). CTY MEANS CONSOLE TELETYPE, DET MEANS THE TELETYPE HAS BEEN DETACHED FROM THE JOB.
4. PROGRAM NAME (WHAT) AS SET BY THE GET, R,RUN COMMANDS AND THE LOADER CUSP (SETNAM UVO). IT IS USUALLY THE LOW SEGMENT NAME.
5. PROGRAM SIZE (SIZE) IN THOUSANDS (K=1024 WORDS) OF WORDS.
6. JOB STATE AND SWAPPED STATE (STATE)
 - *C USER HAS TYPED CONTROL C, JOB HAS HAD ERROR OR EXITED.
 - TI TELETYPE IO WAIT
 - DI DISK IO WAIT
 - IO IO WAIT FOR ANY OTHER DEVICE
 - RN RUNNING (MAYBE SWAPPED OUT OR ON WAY AS WELL AS IN CORE)
 - WS WAIT SATISFIED
 - TS TTY WAIT SATISFIED
 - DS DISK WAIT SATISFIED
 - ST SYSTEM TAPE WAIT
 - AU ALTER UFD WAIT
 - MQ MONITOR BUFFER WAIT
 - DA DISK ALLOCATION WAIT
 - CB DISK CORE BLOCK SCAN WAIT
 - DT DECTAPE CONTROL WAIT
 - DC DATA CONTROL WAIT
 - MT MAGTAPE CONTROL WAIT
 - SL PROGRAM IS SLEEPING
 - SW LOW SEGMENT IS SWAPPED OR ON WAY IN OR OUT
 - SWF LOW SEGMENT IS SWAPPED OR ON WAY IN OR OUT AND BECAUSE SWAPPING SPACE IS NEAR FULL THE LOW SEGMENT IS FRAGMENTED ON THE DISK.
7. JOB RUN TIME (RUNTIME) SINCE LOGGED IN,

(8.1 CONT'D)

HIGH SEGMENTS

EACH HIGH SEGMENT CURRENTLY IN AT LEAST ONE JOB'S VIRTUAL ADDRESSING SPACE HAS THE FOLLOWING INFORMATION TYPED OUT:

1. HIGH SEGMENT NAME (PROGRAM), IF THE HIGH SEGMENT IS NOT SHARABLE, THE UNLIKELY NAME (PRIV) FOR PRIVATE IS TYPED, IF THE HIGH SEGMENT HAS BEEN SUPERCEDED, THE UNLIKELY NAME (OBS) FOR OBSOLETE IS TYPED.
2. DEVICE OR FILE STRUCTURE FROM WHICH THE SEGMENT CAME.
3. DIRECTORY NAME (OWNER) FROM WHICH THE HIGH SEGMENT CAME, IF ONE OF THE JOBS USING THE HIGH SEGMENT IS DETACHED AND THE PROJECT-PROGRAMMER NUMBER OF THE HIGH SEGMENT IS THE SAME AS HIS, **.* IS SUBSTITUTED TO FURTHER PROTECT THE USER FROM HAVING HIS DETACHED JOB ATTACHED TO BY SOMEONE ELSE.
4. SIZE OF HIGH SEGMENT (HIGH K) IN THOUSANDS OF WORDS (K=1024 WORDS).
 - 4A. IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN CORE, SW IS PRINTED.
 - 4B. IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN CORE AND IS FRAGMENTED, SWF IS PRINTED.
 - 4C. IF HIGH SEG IS IN CORE BUT IS FRAGMENTED ON DISK TOO, F IS PRINTED.
5. NO. OF USERS IN WHOSE VIRTUAL ADDRESSING SPACE THE HIGH SEGMENT APPEARS.

DORMANT SEGMENTS:

EACH SHARABLE HIGH SEGMENT WHICH IS CURRENTLY NOT IN ANY JOB'S VIRTUAL ADDRESSING SPACE HAS THE FOLLOWING INFORMATION TYPED OUT:

1. HIGH SEGMENT NAME (PROGRAM)
2. DEVICE NAME FROM WHICH IT CAME.
3. DIRECTORY NAME (OWNER) FROM WHICH THE HIGH SEGMENT CAME
4. SIZE OF HIGH SEGMENT (HIGH K) IN THOUSANDS OF WORDS (K=1024 WORDS).
 - 4A. IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN CORE, SW IS PRINTED.
 - 4B. IF HIGH SEGMENT IS SWAPPED OUT AND IS NOT IN CORE, AND IS FRAGMENTED, SWF IS PRINTED.
 - 4C. IF HIGH SEGMENT IS IN CORE BUT IS FRAGMENTED ON THE DISK TOO, F IS PRINTED.

PERCENT SWAPPING SPACE USED BY ACTIVE AND DORMANT HIGH AND LOW SEGMENTS IS COMPUTED BY TAKING THE RATIO OF K OF SWAPPING SPACE USED DIVIDED BY THE TOTAL K PREALLOCATED AT REFRESH TIME FOR SWAPPING (EACH HIGH SEGMENT IS ONLY COUNTED ONCE). THIS STATISTIC GIVES THE SYSTEM ADMINISTRATOR SOME INFORMATION FOR DETERMINING THE OPTIMUM AMOUNT OF SWAPPING SPACE TO ASSIGN. TOO MUCH SWAPPING SPACE WASTES DISK SPACE, WHILE TOO LITTLE SPACE CAN CAUSE BAD FRAGMENTATION (HENCE SLOWER SWAPPING) OR EXHAUSTION OF VIRTUAL CORE.

PERCENT VIRTUAL CORE USED BY ACTIVE HIGH AND LOW SEGMENTS IS COMPUTED BY TAKING THE RATIO OF K OF VIRTUAL CORE USED (EACH HIGH SEGMENT IS ONLY COUNTED ONCE NO MATTER HOW MANY USERS ARE SHARING AND DORMANT SEGMENTS ARE NOT COUNTED AT ALL) DIVIDED BY THE TOTAL K PREALLOCATED AT REFRESH TIME FOR SWAPPING. THIS PERCENTAGE CAN BE HIGHER OR LOWER THAN THE PERCENT OF SWAPPING SPACE USED. THE SWAPPING RATIO IS A MEASURE OF HOW MANY TIMES PHYSICAL CORE IS EXCEEDED BY THE TOTAL SIZE OF ALL JOBS IN SYSTEM. THE SWAPPING RATIO IS COMPUTED BY TAKING THE RATIO OF K OF VIRTUAL CORE USED BY ACTIVE HIGH AND LOW SEGMENTS TO THE SIZE OF USER CORE. EACH ACTIVE HIGH SEGMENT IS ONLY COUNTED ONCE AND DORMANT SEGMENTS ARE NOT COUNTED AT ALL).

IF PHYSICAL CORE EXCEEDS THE CURRENT USAGE, THE NUMBER OF K OF CORE LEFT IS REPORTED INSTEAD.

THE PERCENT OF VIRTUAL CORE SAVED BY SHARING IS COMPUTED BY SUMMING THE NO. OF K IN ACTIVE HIGH SEGMENTS MULTIPLIED BY THE NUMBERS OF JOBS MINUS ONE USING THE HIGH SEGMENT AND DIVIDING BY THE SUM OF THAT SAME QUANTITY PLUS THE TOTAL VIRTUAL CORE USED.

BUSY DEVICES:

1. DEVICE NAME (DEVICE)
2. JOB NUMBER USING THE DEVICE (DJOB)
3. HOW DEVICE IS ASSIGNED (WHY)

ASSIGNED BY CONSOLE ASSIGN COMMAND - AS
ASSIGNED BY PROGRAM (INIT OR OPEN UO) - INIT
ASSIGNED BOTH WAYS - AS+INIT

SYSTEM FILE STRUCTURES:

EACH FILE STRUCTURE KNOWN TO THE SYSTEM IS PRINTED.

SELECTED OUTPUT:

OFTEN A USER IS ONLY INTERESTED IN PART OF THE OUTPUT.
ANY SUBSET OF THE OUTPUT MAY BE SELECTED BY TYPING
ONE OR MORE SINGLE LETTERS AS AN ARGUMENT TO THE SYSTAT
COMMAND. THE LETTERS MAY BE TYPED IN ANY ORDER, THE LETTERS
ARE BDFHJS

B - JUST BUSY DEVICES
D - DORMANT SEGMENTS
F - FILE STRUCTURES
H - EVERYTHING EXCEPT JOB INFORMATION
J - JUST JOB INFORMATION
S - SHORT JOB PRINTOUT - STATE AND RUN TIME ARE NOT PRINTED

EXAMPLE:

.SYSTAT BD
PRINTS BUSY DEVICES AND DORMANT SEGMENTS.

SUBJECT: FAILSAFE VERSION 27

DATE: JUNE 10, 1970

TO:

FROM: C. MCCOMAS

THE INFORMATION IN THIS MEMORANDUM IS
SUBJECT TO CHANGE WITHOUT NOTICE AND
SHOULD NOT BE CONSTRUED AS A COMMIT-
MENT BY DIGITAL EQUIPMENT CORPORATION.

UFD'S ARE NOW SAVED, BUT ONLY THE LOOKUP INFO. IS SAVED FOR UFD FILES. NO DATA WORDS ARE SAVED FOR UFD'S. THE 1,1 AREAS CONTAIN ONLY UFD'S & ARE THE FIRST AREA FOR EACH STRUCTURE.

THOSE FILES MARKED BY THE MONITOR AS "DO NOT FAILSAFE" FILES (SAT.SYS, BADBLK.SYS, ETC) ARE NOT SAVED.

2) ALL VERSION 27 COMMANDS ARE THE SAME AS IN VERSION 16, EXCEPT AS FOLLOWS:

/S SAVES ALL STRUCTURES

/SDSKA,DSKC,DPA6 SAVES ONLY THOSE STRUCTURES & DEVICES NAMED.

/U SAVES ALL OF THE USER'S AREAS

/UDSKB SAVES JUST USER'S AREAS ON NAMED STRUCTURES.

A MAX. OF 16 ARGS MAY BE USED AFTER /S OR /U.

RESTORE COMMANDS WORK AS FOLLOWS:

IF POSSIBLE EACH FILE IS RESTORED TO THE STRUCTURE IT CAME FROM. IF THIS IS NOT POSSIBLE, AN ATTEMPT IS MADE TO RESTORE THE FILE TO SOME OTHER STRUCTURE; THE ONE WITH THE MOST ROOM IF POSSIBLE.

THE NEW /G COMMAND HAS BEEN INCLUDED. THIS ENABLES THE USER TO RUN THE /U AND /L COMMANDS FOR A USER OTHER THAN HIMSELF. THE FORMAT IS */GMMM,NNN<C,R,>
THIS CHANGES THE SINGLE-USER PROJECT-PROGRAMMER NUMBER SWITCH FROM THAT OF THE FAILSAFE USER (THE VALUE IT HAS INITIALLY) TO MMM,NNN. THIS NEW VALUE IS RETAINED UNTIL THE NEXT /G COMMAND.

3) OTHER CHANGES IN THE OPERATION OF FAILSAFE:

FAILSAFE DOES NOT CHANGE THE ACCESS DATE OF FILES WHICH IT SAVES OR RESTORES.

ON RESTORING WITHOUT THE /N SWITCH, FAILSAFE DOES NOT OVERWRITE EXISTING DISK FILES WHICH HAVE THE SAME CREATION DATE AND TIME AS A CORRESPONDING FILE ON TAPE.

4) TO RESTORE OLD FORMAT TAPES USE R FAILCD
(A RESTORE ONLY FAILSAFE FOR RESTORING LEVEL C TAPES TO A LEVEL D DISK).

FLOW CHART FOR /R FOLLOWS:

R1: READ UFD INFO FROM TAPE
IF SOURCE FILE STR. NO LONGER EXISTS, GO TO R5
IF THIS UFD DOES NOT EXIST ON THIS STR., GO TO R3

R2: IF NEXT FILE WILL NOT FIT IN EXISTING QUOTA, ERROR
OTHERWISE GO TO R4

R3: CREATE A UFD ON THIS STR. WITH ORIGINAL QUOTA

R4: RESTORE FILE TO THIS STR. (IF IT FITS)
IF STR. OVERFLOWS, GO TO R6
OTHERWISE GO TO R2

R5: IF THIS UFD DOES EXIST IN SOME OTHER FILE STR, GO TO R8

R6: IF NO OTHER STRUCTURE EXISTS, ERROR
CHOOSE EMPTIEST STRUCTURE IN SYSTEM
CREATE UFD WITH INFINITE QUOTA

R7: RESTORE NEXT FILE (IF IT FITS)
IF STR. OVERFLOWS, GO TO R6
OTHERWISE GO TO R7

R8: IF NEXT FILE DOES NOT FIT IN QUOTA, GO TO R9
RESTORE FILE (IF IT FITS)
IF STR. OVERFLOWS, GO TO R9
OTHERWISE GO TO R8

R9: IF THIS UFD DOES NOT EXIST IN ANY OTHER STR., ERROR
OTHERWISE GO TO R8

FAILSAFE DOCUMENTATION CHANGES

(CHANGES TO CHAPTER 5, SYSTEM MANAGER'S GUIDE, NOTEBOOK 3)

PAGE

- 5-1 CHANGE *SAT*,SYS TO SAT,SYS
 DELETE "EXCEPT UFD'S" ON /S
 ADD PRIMARY FUNCTION /M (AUTOMATICALLY REPEAT
 LAST SAVE FUNCTION AT STATED INTERVALS)
 ADD /G (ENABLE /U, /L, & SELECTIVE RESTORE
 OF AN AREA DIFFERENT FROM THE USER'S)
- 5-2 THE TAPE FORMAT HAS CHANGED AS ABOVE.
 USRCD BIT IS NOT USED
- 5-17 /2 SETS MTA DENSITY TO 200 BPI (INSTEAD OF /Z)

*** FOR MORE EFFICIENT USE OF FAILSAFE ***

WHEN RESTORING AFTER REFRESHING THE DISK, USE THE /N SWITCH TO
SPEED THINGS UP. E.G., */N/R
THIS AVOIDS DOING A LOOKUP FOR EACH FILE.

NOTES ON RUNNING FAILSAFE FOR THE NON-[1,2] USER

1) TO SAVE ALL HIS FILES ON A TAPE

```
.AS MTA# FAILSA
.R FAILSA
*/U
```

2) TO LIST THE NAMES OF HIS FILES ON A FAILSAFE TAPE

```
.AS MTA# FAILSA
.R FAILSA (DIRECTORY GOES TO TTY)
*/L
```

```
.AS MTA# FAILSA
.AS DSK LST
.R FAILSA
*/P (DIRECTORY GOES TO DSK\FAILSA.DIR)
```

3) TO RESTORE SOME OF HIS FILES TO DISK

```
.AS MTA# FAILSA
.R FAILSA
**,* (RESTORES ALL FILES)
```

OR

```
*NAME,* (RESTORES ALL FILES WITH NAME "NAME"
        BUT ARBITRARY EXTENSION)
```

OR

```
**EXT (RESTORES ALL FILES WITH EXTENSION "EXT"
      BUT ARBITRARY NAME)
```

OR

```
*FIL.1,FIL.2,FIL.3 (RESTORES SPECIFIED FILES)
```

SUBJECT: FAILED VERSION 6
TO:

DATE: MAY 27, 1970
FROM: C, MCCOMAS

THE INFORMATION IN THIS MEMORANDUM IS
SUBJECT TO CHANGE WITHOUT NOTICE AND
SHOULD NOT BE CONSTRUED AS A COMMIT-
MENT BY DIGITAL EQUIPMENT CORPORATION.

FAILCD VERSION 6

(ESSENTIALLY THE SAME AS VERSION 1)

FAILCD IS A RESTORE ONLY FAILSAFE FOR RESTORING OLD FORMAT
FAILSAFE TAPES (VERSION 16 & EARLIER) TO A LEVEL D SYSTEM.

ALL FAILSAFE VERSION 16 COMMANDS ARE AVAILABLE
EXCEPT:

/S, /U, /M, AND /K

OPERATION IS THE SAME AS FAILSAFE VERSION 16.

THE NEW /G COMMAND HAS BEEN INCLUDED. THIS ENABLES THE USER
TO RUN THE /U AND /L COMMANDS FOR A USER OTHER THAN HIMSELF.
THE FORMAT IS */GMMM,NNN<C,R,>
THIS CHANGES THE SINGLE-USER PROJECT-PROGRAMMER NUMBER SWITCH
FROM THAT OF THE FAILSAFE USER (THE VALUE IT HAS INITIALLY)
TO MMM,NNN. THIS NEW VALUE IS RETAINED UNTIL THE NEXT /G
COMMAND.

LEVEL C PROTECTION CODES ARE CHANGED TO LEVEL D
PROTECTION CODES AS FOLLOWS:

LEVEL C PROTECTION	LEVEL D PROTECTION
0	0
1	5
2	7
3	7
4	1
5	5
6	2
7	7

FILES WITH PROJECT-PROGRAMMER NUMBER 1,1 ARE
RESTORED (BY BOTH /R & SELECTIVE RESTORE)
TO THE 1,4 AREA.

SUBJECT: FAILDC VERSION 4

DATE: MAY 27, 1970

TO:

FROM: C. MCCOMAS

THE INFORMATION IN THIS MEMORANDUM IS
SUBJECT TO CHANGE WITHOUT NOTICE AND
SHOULD NOT BE CONSTRUED AS A COMMIT-
MENT BY DIGITAL EQUIPMENT CORPORATION,

(ESSENTIALLY THE SAME AS VERSION 1)
 FAILDC VERSION 4

FAILDC IS A SAVE ONLY FAILSAFE FOR SAVING LEVEL D
 DISK FILES ON MAGNETIC TAPE IN THE OLD FORMAT (COMPATIBLE
 WITH FAILSAFE VERSION 16 & EARLIER).

ALL FAILSAFE VERSION 16 COMMANDS ARE AVAILABLE
 EXCEPT:

/R AND SELECTIVE RESTORE

OPERATION IS THE SAME AS FAILSAFE VERSION 16.

THE NEW /G COMMAND HAS BEEN INCLUDED. THIS ENABLES THE USER
 TO RUN THE /U AND /L COMMANDS FOR A USER OTHER THAN HIMSELF.
 THE FORMAT IS */GMMM,NNN<C,R,>
 THIS CHANGES THE SINGLE-USER PROJECT-PROGRAMMER NUMBER SWITCH
 FROM THAT OF THE FAILSAFE USER (THE VALUE IT HAS INITIALLY)
 TO MMM,NNN. THIS NEW VALUE IS RETAINED UNTIL THE NEXT /G
 COMMAND.

LEVEL D PROTECTION CODES ARE CHANGED TO LEVEL C
 PROTECTION CODES AS FOLLOWS:

LEVEL D PROTECTION	LEVEL C PROTECTION
0	0
1	4
2	4
3	4
4	4
5	5
6	5
7	0

ALL FILES IN THE 1.4 AREA ARE SAVED (BY BOTH /S & /U) WITH
 PROJECT-PROGRAMMER NUMBER 1.1.

100-472-002-00

BOOTS

Level D Disk Bootstrap

Program Description

Revision Date: 10 June 70

Author: R. Clements

Introduction

BOOTS is a bootstrap program for use with the Level D disk service of the PDP-10 timesharing monitor. BOOTS has two main functions:

- 1) Loading a program into core from a disk SAVE file;
and
- 2) Dumping core out as a SAVE file (for later analysis of a crashed monitor).

BOOTS runs in EXEC mode, of course, and is loaded into the top 1K of core. Due to the lack of READ-IN mode for the various disk controllers, BOOTS is usually loaded from paper tape.

Operation:

The operation of BOOTS is as follows:

- 1) Load paper tape of BOOTS into paper tape reader.
- 2) Set READ-IN DEVICE switches to 104, press STOP, RESET, READIN.
- 3) When paper tape has been read, BOOTS starts and types a carriage return.
- 4) Type in command string, terminated by carriage return.
- 5) After performing the command, BOOTS either restarts itself, or transfers to the newly loaded program, as appropriate for the command.

Command string format:

The general form of a BOOTS command is:

STRUCTURE:FILE,EXT[PROJ,PROG]/SWITCH

For any fields not supplied, defaults are assumed. The SWITCH field determines what operation is to be performed. The STRUCTURE field is a file structure name within the disk file system, NOT a physical device name.

Available operations:

1) No switch - means find the specified file, clear core, read the file into core, set the PROGRAM START ADDRESS as specified by the file, and start at that address. I.e., load and run the program. The default FILE name is SYSTEM.SAV.

2) /L - means do all of the above, including setting the PROGRAM START ADDRESS, except do not start the loaded program. I.e., Load the program. Default FILE name is SYSTEM.SAV.

3) /D - means find the specified file, write out core (from location 20 through the base of BOOTS) onto the file, and write the current PROGRAM START ADDRESS onto the file. I.e., Dump core.

NOTE THAT THE SPECIFIED FILE MUST ALREADY EXIST! It is updated, not created. The file, when read, will not have correct checksums. The default file name is CRASH.SAV.

4) /n - where "n" is an octal number - means set the PROGRAM START ADDRESS to n. This command should be used prior to dumping core if the program is to be loaded and run by BOOTS in the future. (This is not necessary for dumping system crashes.)

5) /G - means Go to the current PROGRAM START ADDRESS.

Defaults:

The default STRUCTURE is DSK: (see "search technique" below).

The default FILE is SYSTEM, except for the /D operation, where it is CRASH.

The default .EXT is .SAV (a blank extension may be specified by explicitly typing the dot with no extension following it).

The default [PROJ, PROG] is [1,4].

The default /SWITCH is "none", i.e., a load and run command.

Search technique

BOOTS searches for a specific file structure (e.g., DSKB) by looking for all possible disks in a predetermined order. That order is: FHA0, FHA1, ..., FHA3, FHB0, ..., FHB3, DPA0, ..., DPA7, DPB0, ..., DPB7. Note that these devices are searched for a structure name written on the device, not for their physical names. BOOTS will not find device DPA0, for example.

The only exception to the rule that the STRUCTURE: requested must be a defined file structure is the special case of DSKI (or blank) as a structure name. In this case, BOOTS will search for the file on structures DSKA:, DSKB:, DSKC:, ..., DSKO:, in that order. As a consequence of this, the common case of dumping a crash on CRASH.SAV would attempt to write the file on DSKA since each structure normally has a file called CRASH.SAV. If the crash is desired on DSKB, (because DSKB is larger, for example), then the DSKB: must be explicitly typed.

Note that the LEVEL D monitor does not require disk structures to be named DSKA:, DSKB:, etc. These are only recommendations. Nothing prevents an installation from creating file structures called SAM: and IRVING:. However, BOOTS would only find such a structure if its name were explicitly typed; BOOTS will not find it in the default structure DSK:, because IRVING: is not in BOOTS's default definition of DSK:. (The LEVEL D monitor would find IRVING: in DSK:, since the monitor is smarter than BOOTS.)

Core allocation:

BOOTS may be assembled for any size of core. When running, it occupies the top 1000 octal words of the core for which it was assembled. It uses all of the next lower 1000 words as buffers, except for the region from 0 to 137 in that 1000 words, which might be a Job's JOB DATA AREA under a crashed monitor, and thus might be needed for analyzing a dump.

The starting address of BOOTS is 1000 below the top of core. For example, 64K BOOTS starts at 177000.

Recapitulation:

To dump a crashed system on DSKB:CRASH,SAV[1,4], type

DSKB:/D

To run a fresh monitor from DSK:SYSTEM,SAV[1,4], type
Just carriage return.

LOOKFL.MEM

V001

JUNE 18 70

LOOKFL IS A PROGRAM WHICH DOES AN EXTENDED LOOKUP ON A FILE AND
PRINTS OUT ALL THE ARGUMENTS. WHEN IT TYPES

FILE: ,TYPE IN A FILE NAME AND RETRIEVE YOUR LISTING FROM DEVICE LPT
(FILE NAME LOOKFL.TXT).

FILE NAME HAS FORM DEVNAME,EXT[PROJ,PROG], UFD'S MAY BE SPECIFIED.

GRIPE.MEM

V001

JUNE 18 70

GRIPE IS A PROGRAM WHICH READS TEXT FROM ITS USER AND RECORDS IT IN A DISK FILE, THIS ENABLES USERS TO RECORD COMMENTS AND COMPLAINTS. TO RUN IT, RUN GRIPE, WHEN IT TYPES YES? TYPE ANY TEXT YOU WISH TERMINATED BY AN ALTMODE, THE TEXT IS WRITTEN AS FILE CMP###,CMP (### IS A RANDOM NUMBER), CURRENTLY IN THE 3,3 AREA, IT ALSO HAS A HEADER INCLUDING THE DATE AND TIME AND USER WRITING THE COMMENT,

DATDMP.MEM

V001

JUNE 18 70

CODE HAS BEEN ADDED TO DATDMP TO ALLOW A SUBSET OF ITS LISTING TO BE PRINTED. IN USER MODE, IT TYPES * AND WAITS FOR THE SUBSET DESIRED TO BE TYPED IN. SUBSET MAY BE FILE,EXTC[PROJ,PROG] TO LIST ENTRIES FOR FILE,EXT [PROJ,PROG], ANY OR ALL MAY BE *, BUT IF ANY FILE IS SPECIFIED AND NO PPN IS SPECIFIED, THE USER'S PPN IS ASSUMED, IF NO FILES OR EXTS ARE SPECIFIED, ALL FILES FOR PPN'S SPECIFIED WILL BE LISTED, CARRIAGE RETURN GIVES THE WHOLE LISTING (I.E. *.*[*,*]).

FOR THOSE PPN'S SPECIFIED, PPB AND UFD BLOCKS ARE PRINTED, AND FOR FILES SPECIFIED, NMB BLOCKS AND ACCESS TABLES ARE PRINTED, THUS, *,MACC10,*] LISTS ALL PPB'S AND UFB'S FOR ALL PROGRAMMERS IN PROJECT 10 WHO CURRENTLY HAVE PPB'S AND GIVES NMB BLOCKS AND ACCESS TABLES FOR ALL FILES WITH EXTENSION MAC FOR THOSE PROGRAMMERS.

IN EXEC MODE, SET LOCATIONS PPNTST, NAMTST, AND EXTST FOR THE DESIRED SUBSET,

PPNTST CONTAINS PPN'S DESIRED, WITH 0 FOR *.

NAMTST CONTAINS SIXBIT NAME TO CHECK, WITH 0 FOR *.

EXTST CONTAINS 0 FOR * OR, IF NON-ZERO, RH=SIXBIT EXT TO CHECK.

THESE LOCATIONS ARE CLEARED AFTER EACH DUMP SO THAT THEY MUST BE RESET EACH TIME.

DSKRAT, MEM

V001

JUNE 18 70

DSKRAT IS A DAMAGE ASSESSMENT PROGRAM FOR LEVEL D DISK FILE STRUCTURES. IT SCANS THE FILE STRUCTURE, USING SUPER USETI'S TO READ FILES AND REPORTS ANY INCONSISTENCIES DETECTED TO DEVICE LPT (FILE NAME RAT.LST IF LPT IS A DIRECTORY DEVICE).

TO RUN DSKRAT, LOG IN AS 1,2 (REQUIRED FOR SUPER USETI), ASSIGN A FILE STRUCTURE LOGICAL NAME STR, ASSIGN LPT IF YOU WISH IT TO BE SOME DEVICE OTHER THAN THE PRINTER, AND RUN DSKRAT. DSKRAT OPENS STR AND LPT, READS SAT BLOCKS INTO CORE AND IF EVERYTHING IS ACCEPTABLE TYPES "RUNNING" AND BEGINS TO SCAN THE FILE STRUCTURE.

FOR EACH FILE ON THE FILE STRUCTURE, DSKRAT LOOKS UP THE FILE AND REPORTS ANY FAILURES, READS AND VERIFIES THE FIRST RIB OF THE FILE, CHECKSUMS EACH GROUP AND REPORTS ERRORS, READS THE RETRIEVAL INFORMATION FROM THE RIB AND CONSTRUCTS ITS OWN SAT BLOCKS. IF THERE ARE ANY DISAGREEMENTS BETWEEN SATS READ FROM DISK AND SATS CONSTRUCTED BY DSKRAT, ERROR MESSAGES ARE OUTPUT; I.E. IF ANY CLUSTER IS IN MORE THAN ONE FILE, OR IN A FILE BUT NOT MARKED IN THE SAT, THAT FACT IS REPORTED, IDENTIFYING THE CLUSTER AND THE FILE TO WHICH IT BELONGS. ONE LINE IS PRODUCED FOR EACH ERROR, INCLUDING THE FILE NAME, CLUSTER NUMBER AND LOGICAL BLOCK NUMBER OF THE CLUSTER IN QUESTION, AND AN ERROR COMMENT.

WHEN DSKRAT HAS GONE COMPLETELY THROUGH THE FILE STRUCTURE, IT PRINTS A LIST OF CLUSTERS IN MORE THAN ONE FILE, CLUSTERS IN FILES BUT NOT MARKED IN SATS, AND CLUSTERS MARKED IN SATS BUT NOT IN ANY FILE. THEN, IF ANY CLUSTERS ARE IN MORE THAN ONE FILE, IT TYPES

"END OF PASS 1, BEGINNING PASS 2"

AND STARTS OVER. THE SECOND PASS WILL PRODUCE AN ERROR LINE FOR EVERY FILE CLAIMING CLUSTERS USED BY MORE THAN ONE FILE (OBVIOUSLY THE FIRST SUCH FILE IS NOT KNOWN IN PASS 1 UNTIL THE SECOND IS FOUND). IF YOU DO NOT WANT PASS 2, TYPE CONTROL C TWICE AND REENTER. THIS WILL CLOSE LPT AND EXIT.

IF NO CLUSTERS ARE IN MORE THAN ONE FILE, IT TYPES

"END OF PASS 1, NO NEED FOR PASS 2"

AND EXITS.

NOTE THAT SINCE DSKRAT READS IN SATS AT THE BEGINNING OF THE PROGRAM, IF OTHER USERS ARE REFERENCING THE DISKS (WRITING OR DELETING FILES OR READING FILES MARKED FOR DELETION) THE SAT BLOCKS WILL NOT BE CURRENT AND YOU WILL GET SPURIOUS ERRORS, HOWEVER, TRUE ERRORS WILL NOT BE MISSED.

FILEX

FILEX IS A GENERAL FILE TRANSFER PROGRAM, INTENDED TO CONVERT BETWEEN VARIOUS CORE IMAGE FORMATS AND TO READ AND WRITE VARIOUS DECTAPE DIRECTORY FORMATS, AS WELL AS STANDARD DISK FILES.

THE COMMANDS TO FILEX ARE SIMILAR TO A PIP COMMAND STRING. FILES ARE TRANSFERRED AS 36-BIT BINARY DATA. NO PROCESSING IS DONE ON THE DATA ITSELF, EXCEPT THAT NECESSARY TO CONVERT BETWEEN VARIOUS CORE IMAGE REPRESENTATIONS.

RAPID TAPE PROCESSING, VIA A DISK SCRATCH FILE, IS AVAILABLE.

"WILD-CARD" FILE NAMES (*) ARE PERMITTED.

DEVICE FORMATS AVAILABLE:

NON-DECTAPE DEVICES ARE READ AND WRITTEN IN BINARY. DEVICE, FILE-NAME, EXTENSION, PROJECT-PROGRAMMER NUMBER, AND PROTECTION ARE SUPPLIED IN THE USUAL WAY.

DECTAPES IN THE USUAL POP10 DIRECTORY FORMAT MAY BE READ OR WRITTEN IN BINARY IN THE USUAL WAY, AND THEY MAY BE READ VIA A DISK SCRATCH FILE, WHICH IS MUCH FASTER FOR EITHER A TAPE WITH MANY FILES, OR A TAPE WHICH HAS BEEN WRITTEN BY TENOMP (WITH CONSECUTIVE BLOCKS ALLOCATED TO THE SAME FILE.)

SIMILARLY, DECTAPES MAY BE READ, WITH OR WITHOUT USE OF A SCRATCH FILE, AND MAY BE WRITTEN, IN EITHER THE OLD DEC PDP-6 DECTAPE FORMAT, OR THE MIT PROJECT MAC PDP6/10 DECTAPE FORMAT. FOR BOTH OF THESE FORMATS, THE MONITOR'S DECTAPE SERVICE ROUTINE CANNOT BE MADE TO RUN EFFICIENTLY, SO THE SCRATCH FILE TECHNIQUE IS ADVISED. THE /O (OLD) AND /M (MAC) SWITCHES SPECIFY THESE FORMATS. /T (TEN) RETURNS TO POP10 FORMAT TAPES.

DATA FORMATS AVAILABLE:

UNLESS ONE OF THE FOLLOWING SPECIAL FORMATS APPLIES, ALL FILES ARE TRANSFERRED UNMODIFIED, AS 36-BIT BINARY DATA.

CORE IMAGE FILES ARE THE SPECIAL CASES HANDLED. PROCESSING IS AVAILABLE TO CONVERT FROM ANY OF THE FOLLOWING FORMATS TO ANY OTHER OF THEM. (OF COURSE, IF THE INPUT AND OUTPUT FORMATS ARE IDENTICAL, THE FILE IS SIMPLY COPIED.)

EACH OF THE FOLLOWING CORE IMAGE FORMATS IS INDICATED BY SPECIFIC EXTENSIONS, WHICH MAY BE OVERRIDDEN BY SWITCHES,

- 1) SAVE-FILE FORMAT: ASSUMED FOR FILES WITH EXTENSIONS ,SAV, ,LOW, AND ,SVE. CAN BE FORCED BY THE /C SWITCH (COMPRESSED CORE IMAGE.) THE DEFAULT OUTPUT EXTENSION FOR A /C FILE IS ,SAV.
- 2) EXPANDED CORE IMAGE FILE (AS USED BY FILEDIT): ASSUMED FOR FILES WITH EXTENSION ,XPN. CAN BE FORCED BY THE /E SWITCH (EXPANDED). THE DEFAULT OUTPUT EXTENSION FOR A /E FILE IS ,XPN.
- 3) DUMP FORMAT (OLD PDP6 VERSION OF SAVE): ASSUMED FOR FILES WITH EXTENSION ,DMP. CAN BE FORCED BY THE /D SWITCH.
- 4) SBLK FORMAT (SIMPLE BLOCK=PROJECT MAC'S EQUIVALENT OF DEC'S ,SAV FORMAT): NOT ASSUMED FOR ANY EXTENSION, BUT IS FORCED BY THE /S SWITCH. THE DEFAULT OUTPUT EXTENSION FOR A /S FILE IS ,BIN.
- 5) THE /B SWITCH CAUSES BINARY PROCESSING EVEN THOUGH A FILE FILE HAS ONE OF THESE SPECIAL EXTENSIONS.

COMMAND FORMAT:

A FILEX COMMAND IS OF THE FORM:

- * OUTPUT SPECIFIER * INPUT SPECIFIER(S)
OR
- * OUTPUT SPECIFIER = INPUT SPECIFIER(S)

OUTPUT SPECIFIER IS:

DEV: NAME ,EXT [P,PN]<PROT>/S OR ...(S(1)S(2)S(3))
WHERE /S INDICATES ANY SWITCH

INPUT SPECIFIER IS:

DEV: NAME ,EXT [P,PN]/S, ... OR
DEV: [P,PN]/S NAME ,EXT, NAME2 ,EXT, ...

IF THE [P,PN] AND/OR /S APPEAR AFTER A DEVICE, THEY APPLY TO ALL FOLLOWING FILES. IF THEY APPEAR AFTER A FILE NAME, THEY APPLY ONLY TO THAT FILENAME.

THE INPUT NAME OR EXT MAY BE *, IN WHICH CASE THE USUAL WILD-CARD PROCESSING OCCURS.

THE OUTPUT NAME OR EXT MAY BE *, IN WHICH CASE THE NAME OR EXT OF THE INPUT FILE IS COPIED.

IF THE OUTPUT NAME OR EXT ARE MISSING, ALMOST THE SAME OCCURS AS FOR *, EXCEPT THAT ALL CORE IMAGE FILES WILL BE WRITTEN WITH THE DEFAULT EXTENSION AND FORMAT APPROPRIATE TO THE OUTPUT DEVICE (UNLESS OVERRIDDEN BY SWITCHES). THAT IS,

*DSK: *DTA1: FOO,DMP/Q WOULD CAUSE

THE DMP FORMAT FILE TO BE COMPRESSED /Q AND WRITTEN AS FOO.SAV, TO CAUSE AN INPUT DECTAPE TO BE PROCESSED QUICKLY (VIA A SCRATCH FILE), USE THE /Q SWITCH (FOR QUICK),

TO CAUSE THE /Q PROCESSING AND PRESERVE THE SCRATCH FILE AFTER PROCESSING, FOR USE BY ANOTHER COMMAND, USE THE /P (PRESERVED QUICK) SWITCH,

TO REUSE A SCRATCH FILE PRESERVED BY /P IN A PREVIOUS COMMAND, USE THE /R (RE-USE) SWITCH,

TO IGNORE READ ERRORS ON THE INPUT DEVICE, USE THE /G (GO ON) SWITCH,

FILEX CHECKS THE ALWAYS-BAD-CHECKSUM BIT IN THE LEVEL 0 DISK FORMAT, SO /G IS NOT NEEDED FOR THOSE FILES WITH ,RPABC ON (E.G. CRASH,SAV),

TO COPY A CRASH,SAV TO AN EXPANDED FORMAT FILE FOR FILEDDT TO EXAMINE, TYPE (FOR EXAMPLE):

DSK1 SER105.SAV[10,10]/E=DSK01 CRASH,SAV[1,4]

WHILE LOGGED IN AS [1,2] (TO BE ABLE TO READ CRASH,SAV, WHICH IS READ-PROTECTED BY THE REFRESHER),

THE /Z SWITCH ON AN OUTPUT FILE, IF IT IS A DECTAPE, CAUSES THE APPROPRIATE FORMAT OF ZEROED DIRECTORY TO BE WRITTEN ON THE TAPE. IF THE STRING

*TAPEID

APPEARS IN THE OUTPUT SPECIFIER, THEN TAPEID IS WRITTEN AS THE TAPE IDENTIFIER IN THE DIRECTORY. TAPEID MAY BE 6 CHARACTERS ON A PDP10 TAPE, 3 CHARACTERS ON A PROJECT MAC TAPE, AND IS NOT PRESENT ON A PDP6 TAPE,

THE /L SWITCH ON AN INPUT DECTAPE FILE CAUSES THE TAPE DIRECTORY TO BE TYPED ON THE TTY. (DO NOT PUT TTY! IN THE OUTPUT FILE SPECIFIER, THAT WOULD TRY TO WRITE FILES ON THE TTY IN BINARY,)

SUMMARY OF FILEX SWITCHES

SWITCH	MEANING	DEFAULT EXTENSION
1. DEC TAPE FORMAT SPECIFIERS		
M	MAC	
O	OLD; PDP-6	
T	TEN; NORMAL PDP-10 DIRECTORY FORMAT	
2. FILE FORMAT SPECIFIERS		
B	BINARY; OVERRIDES DEFAULT EXTENSION	
C	COMPRESSED; SAVED FILE FORMAT	SAV
		LOW
		SVE
D	DUMP; OLD PDP-6	DMP
E	EXPANDED; FOR FILDDT	XPB
S	SBLK; PROJECT MAC'S SAVE	BIN
3. DEC TAPE PROCESSING SWITCHES		
G	GO ON; IGNORE READ ERRORS	
L	LIST; TYPE DIRECTORY ON TTY	
P	PRESERVED; Q PLUS KEEP FILE	
Q	QUICK; USE SCRATCH FILE FOR DIRECTORY	
R	REUSE; SCRATCH DIRECTORY FROM P	
Z	ZERO; DECTAPE DIRECTORY	
*N(1)...N(6)- SPECIFY TAPE IDENTIFIER		

QUOLST, MEM

JULY 1 1970
V001

QUOLST IS A PROGRAM WHICH TYPES ON DEVICE TTY ITS USER'S QUOTAS
(RESERVED, FIRST COME FIRST SERVED, AND LOGGED OUT), AND BLOCKS
FREE WITH RESPECT TO LOGGED IN QUOTA (RESERVED + FIRST COME FIRST
SERVED). ONLY THOSE FILE STRUCTURES CURRENTLY IN THE FILE STRUCTURE
SEARCH LIST ARE CHECKED.

PLEASE

FUNCTION

THE PLEASE COMMAND IS AVAILABLE TO PROVIDE NON-CONFLICTING COMMUNICATION BETWEEN AN OPERATOR AND SYSTEM USERS VIA TTY0. USE OF THE PLEASE COMMAND IS PREFERRED TO "TALK OPR" BECAUSE PLEASE PREVENTS SIMULTANEOUS TRANSMISSION TO THE OPERATOR VIA TTY0.

1.

USER INTERFACE

FOR THIS DESCRIPTION LET \$ REPRESENT <ALTMODE> AND LET * REPRESENT ANY ARBITRARY TEXT EXCLUDING CONTROL CHARACTERS. THE OPERATION OF PLEASE FOLLOWS:

USER TYPES: PLEASE * <CR>
SYSTEM RESPONDS: A) OPERATOR HAS BEEN NOTIFIED
OR B) OPERATOR BUSY, HANG ON PLEASE

IN CASE A THE USER MAY IMMEDIATELY BEGIN TWO-WAY TTY COMMUNICATION WITH THE OPERATOR, COMMUNICATION IS TERMINATED WHEN EITHER END TYPES \$. IF THE OPERATOR IS BUSY THE USER MAY ELECT TO WAIT FOR A MESSAGE AT WHICH TIME HE MAY COMMUNICATE WITH THE OPERATOR, HOWEVER, HE MAY TYPE *C OR \$ TO ABORT AND RETURN TO MONITOR MODE.

2. OPERATOR INTERFACE

TTYØ AT THE COMPUTER SITE MUST BE DEDICATED TO THE USE OF THE PLEASE FUNCTION. ON TTYØ THE OPERATOR RECEIVES JOB IDENTIFYING INFORMATION AND THE USER'S MESSAGES AND TRANSMITS HIS RESPONSES.

THE BASIC FORM OF A PLEASE CONVERSATION AS IT APPEARS TO THE OPERATOR IS SHOWN BELOW:

PREAMBLE
JOB IDENTIFYING INFORMATION
PLEASE*
CONVERSATION
TERMINATING MESSAGE

THE JOB IDENTIFYING INFORMATION IS PRESENTED AS:

JOBN [PROJECT#, PROGRAMMER#] TTYN T1 T2

THAT IS, THE INITIATING JOB NUMBER, PROJECT PROGRAMMER NUMBER AND TELETYPE, T1 IS THE TIME THE USER TYPED HIS PLEASE REQUEST, WHEREAS T2 IS THE TIME THE OPERATOR RECEIVED THE REQUEST.

WHEN EITHER PARTY TYPES <ALT-MODE> THE CONVERSATION PORTION TERMINATES, AND THE TERMINATING MESSAGE "FINISHED T3" IS TYPED TO THE OPERATOR. T3 IS NATURALLY THE TIME WHEN TRANSMISSION TERMINATES.

FILE(UMOUNT) - INTRODUCTION

THE FILE COMMAND PROVIDES REMOTE CONTROL OF DECTAPE TO DISK AND DISK TO DECTAPE TRANSFERS ON OPERATOR HANDLED DECTAPES. THIS COMMAND ALLOWS DECTAPE TO BE USED AS CONVENIENT BACKUP STORAGE FOR A SMALL DISK SYSTEM. THE COMMAND IS IMPLEMENTED IN THE UMOUNT CUSP. THE USER REQUESTS FILEING OF DATA ONTO DECTAPE, AND RECALLING DATA FROM DECTAPE, BY USING THE FILE COMMAND.

THE USER DESCRIBES THE OPERATION HE WISHES PERFORMED, AND THEN IS FREE TO DO OTHER WORK WHILE THE OPERATOR HANDLES THE TAPE OPERATIONS. HE CAN CHECK ON THE PROGRESS OF HIS REQUESTS, BUT IS NOT SPECIFICALLY INFORMED WHEN THE REQUESTS ARE COMPLETED.

THERE ARE SIX OPERATIONS WHICH CAN BE PERFORMED VIA THE FILE COMMAND: F, Z, R, L, D AND C. THESE ARE DESCRIBED BELOW. THE OTHER ARGUMENTS REQUIRED BY THE FILE COMMAND ARE TAPE ID'S AND FILENAMES. THE TAPE ID IS THE IDENTIFICATION NUMBER OF THE ROLL OF DECTAPE TO BE USED. THIS IS USUALLY A NUMBER (STARTING AT 1 FOR EACH USER), BUT MAY BE A SHARED TAPE, DESCRIBED BY A LETTER AND A NUMBER: FOR EXAMPLE, "A123" MIGHT BE A TAPE SHARED BY ALL USERS.

FILENAMES ARE THE USUAL NAME AND EXTENSION PAIR FOR DISK AND DECTAPE FILES. THE "*" CONVENTION IS ALSO A LEGAL NAME OR EXTENSION: FOR EXAMPLE, *.MAC MEANS "ALL FILE WITH EXTENSION MAC".

1. OPTIONS OF THE FILE COMMAND

- 1) F (FOR FILE) OPTION: THIS OPTION IS A REQUEST TO FILE INFORMATION ON DECTAPE. IT TAKES A TAPE ID AND A LIST OF FILENAMES AS ARGUMENTS.

EXAMPLE:

.FILE F,1, TEST,MAC, DATA,BIN

IS A REQUEST TO PUT THE FILES TEST,MAC AND DATA,BIN ONTO THE USER'S DECTAPE NUMBER 1. AT THE COMPLETION OF THE FILE OPERATION, AN AUTOMATIC FILE D (DIRECTORY) COMMAND WILL BE PERFORMED (SEE BELOW), ALTHOUGH A USER COULD LOGOUT AFTER A FILE REQUEST AND EXPECT THE PROCESS TO GO TO COMPLETION (IF HE SAVED THE FILES DURING THE LOGOUT DIALOGUE). THE PRACTICE IS NOT RECOMMENDED, BECAUSE THE FILES WILL NOT BE DELETED FROM THE DISK.

V023
V023

- 2) Z (ZERO) OPTION: THIS OPTION IS IDENTICAL TO THE F (FILE) OPTION, EXCEPT THAT THE DIRECTORY OF THE DECTAPE WILL BE CLEARED (ZEROED) BEFORE THE FILES ARE COPIED. AGAIN, A FILE D COMMAND WILL BE PERFORMED AFTER THE FILES ARE COPIED.
- 3) R (RECALL) OPTION: THIS OPTION IS A REQUEST TO RECALL INFORMATION FROM DECTAPE TO THE DISK. THE ARGUMENTS ARE THE SAME AS FOR THE F AND Z OPTIONS. AGAIN, A FILE D COMMAND WILL BE PERFORMED AFTER THE FILES ARE TRANSFERRED.

EXAMPLE:

.FILE F,1, *.*

IS A REQUEST TO RESTORE ALL FILES FROM THE USER'S DECTAPE NUMBER 1.

(1 CONT)

- 4) L (LIST DIRECTORY) OPTION: THIS OPTION IS A REQUEST TO READ THE DIRECTORY OF A DECTAPE. THE D OPTION REQUIRES ONLY ONE ARGUMENT, THE DECTAPE TAPE ID,

EXAMPLE:

.FILE D,2

IS A REQUEST TO READ THE DIRECTORY OF THE USER'S TAPE NUMBER 2. THE DIRECTORY WILL BE PLACED IN THE USER'S DISK AREA AS AN ASCII FILE WITH THE NAME TAPEID,DIR, WHERE TAPEID IS THE NAME OF THE USER'S DECTAPE. THUS, IN THE ABOVE EXAMPLE, THE USER MAY READ THE DIRECTORY FOR TAPE 2 BY THE MONITOR COMMAND:

.TYPE 2,DIR

A DIRECTORY OPTION IS PERFORMED AT THE COMPLETION OF EACH F, Z, OR R OPTION.

- 5) D (DELETE) DELETES FILES MENTIONED FROM DECTAPE.
- 6) C (CHECK) OPTION: THIS OPTION CAUSES THE QUEUE OF FILE COMMANDS TO BE READ TO DETERMINE WHETHER ANY OF THE USER'S REQUESTS ARE STILL PENDING. IF NONE ARE PENDING, THE MESSAGE "NONE PENDING" IS TYPED. IF THERE ARE SOME REQUESTS PENDING, THEY WILL BE LISTED. THIS OPTION DOES NOT USE ANY TAPE OR FILE ARGUMENTS, THE CURRENT POSITION IN THE QUEUE OF EACH REQUEST IS TYPED AT THE BEGINNING OF THE LINE DESCRIBING THAT REQUEST.

EXAMPLE:

.FILE C

2. DIALOGUE FORM

IF THE FILE COMMAND IS EXECUTED WITHOUT AN ARGUMENT, A BRIEF DIALOGUE WILL BE PERFORMED. THIS MAY BE EASIER FOR A BEGINNER TO FOLLOW. AN EXAMPLE FOLLOWS:

.FILE
C, D, F, R OR Z (? FOR HELP)
*F
TAPE ID: 1
FILES: A, B, C
REQUEST STORED

1, OPERATOR REQUIRMENTS

1.1. HARDWARE ENVIRONMENTS

OPERATION OF THE FILE-RECALL SYSTEM REQUIRES

- A) A DEDICATED DECTAPE DRIVE
- B) A CONTROLLING TTY
- C) DISK FILE STORAGE OF SOME TYPE

1.1. STARTUP

THE OPERATOR LOGS IN UNDER [1,2] ON AN AVAILABLE LOCAL TTY AND ASSIGNS ANY PARTICULAR DECTAPE DRIVE SAY 2, TO BE USED BY THE FILE-RECALL SYSTEM, HE TYPES R OMOUNT AND STARTUP IS COMPLETE.

2, OPERATION

USER REQUESTS ARE STACKED AS ASCII COMMAND FILES UNDER 3,3,UFD WITH ORDER OF RECEIPT (AND HENCE EXECUTION) INDICATED BY THE COMMAND FILE NAMES; E.G., FIL1.CMD, FIL2.CMD, ... THE PROGRAM OFFILE READS THESE REQUESTS IN ORDER, COMMUNICATING WITH THE OPERATOR ON THE CONTROLLING TTY,

A TYPICAL MESSAGE FROM OFFILE IS OF THE FORM:

PLEASE MOUNT TAPE # FOR USER #, # ON DRIVE:

(2. CONT'D)

THE OPERATOR RETRIEVES THE SPECIFIED DECTAPE
MOUNTS IT UPON THE PREVIOUSLY
ASSIGNED DRIVE AND COMMANDS OFFILE TO PROCEED BY TYPING THE
DRIVE NUMBER TERMINATED BY A CARRIAGE RETURN (IN THIS CASE, 2).
OFFILE REPLIES WITH THE CURRENT ASCII COMMAND FILE AND SIGNIFIES
COMPLETION OF THE FILE-RECALL OPERATION WITH AN APPROPRIATE
MESSAGE.

3. UNUSUAL ACTIONS

OMOUNT INFORMS THE OPERATOR OF ANY ERRORS OCCURRING WHILE
TRANSFERRING FILES. THE OPERATOR MAY REPEAT THE CURRENT FILE
OPERATION BY RESTARTING OMOUNT OR MAY DISCARD THE CURRENT REQUEST
BY TYPING:

*C
.REENTER

AT THE TIME WHEN OMOUNT IS WAITING FOR A DRIVE #,
THE OPERATION WOULD APPEAR AS FOLLOWS:
PLEASE MOUNT TAPE # FOR USER #, # ON DRIVE: *C

REENTER

WHEN *C, REENTER IS RECEIVED IN THIS FASHION OFFILE RESPONDS
BY PRINTING THE DISCARDED COMMAND LINE AND AN APPROPRIATE
IDENTIFYING MESSAGE.

1.0 DC10E HANDLER

1.1 BACKGROUND

THIS SPECIFICATION DESCRIBES THE INITIAL IMPLEMENTATION OF THE DC10E DATASET-CONTROL SERVICE ROUTINE, AND ITS REQUIRED HARDWARE ENVIRONMENT. THIS ROUTINE IS INTENDED AS THE NECESSARY LEVEL OF SOFTWARE SUPPORT FOR EARLY DC10E'S. FEATURES DESCRIBED HERE WILL BE EXPANDED UPON IN LATER WORK IN THE LOCAL COMMUNICATIONS SOFTWARE PROJECT,

1.2 HARDWARE ENVIRONMENT

1.2.1 THIS ROUTINE WILL SUPPORT UP TO FOUR DC10E DATASET HANDLERS ON A DC10 DATALINE SCANNER, EACH LINE TO BE CONNECTED TO THE DC10E IS ASSUMED DO BE A BELL-SYSTEM

(1.2.1 CONT'D)

103A DATASET, OR ITS EQUIVALENT,

- 1.2.2 THE AUTOMATIC-DIALLER FEATURES OF THE DC10E ARE NOT SUPPORTED.
- 1.2.3 LINE-NUMBERS OF THE EQUIPMENT MUST BE ASSIGNED AS FOLLOWS:
 - 1.2.3.1 THE FIRST LINE-GROUP(S) ON THE DC10 (LINES 0-7, 10,17, ETC.) ARE ASSIGNED TO DC10B 8-LINE GROUPS,
 - 1.2.3.2 DC10E EXPANDED DATASET CONTROLS ARE ASSIGNED TO THE NEXT LINE GROUPS IMMEDIATELY ABOVE THE DC10B'S,
 - 1.2.3.3 ANY SPARE LINE GROUPS WILL BE THE REMAINING HIGHEST-NUMBERED LINES (X0-77).
 - 1.2.3.4 THE ASSOCIATION BETWEEN THE DC10B LINE NUMBER BY WHICH THE DATA IS PASSED, AND TAG DC10E LINE NUMBER BY WHICH THE SUPERVISION OF THE DATASET IS MAINTAINED, IS ARBITRARY, THIS ASSOCIATION IS SPECIFIED BY THE CUSTOMER TO THE MONITOR VIA THE MONGEN PROGRAM, AND IS RETAINED BY THE MONITOR IN A TABLE IN SUB-ROUTINE COMMON, THE PHYSICAL NAME "TTYN" OF THE LINE IS DETERMINED BY THE DC10B LINE NUMBER.
- 1.2.4 EACH LINE OF THE DC10E AND ASSOCIATED DC10B SHALL BE WIRED AS FOLLOWS: (REFERENCE THE DC10 TECHNICAL MANUAL DEC-10-18AA-D AS REVISED, AND BELL SYSTEM DATA COMMUNICATIONS TECHNICAL REFERENCE MANUAL, DATA SET 103A INTERFACE SPECIFICATION),
 - 1.2.4.1 CIRCUIT BA, TRANSMITTED DATA, SHALL BE CONNECTED TO THE DC10B CIRCUIT LN PNTR EIA.
 - 1.2.4.2 CIRCUIT BB, RECEIVED DATA, SHALL BE CONNECTED TO THE DC10B CIRCUIT LN KYBD EIA.
 - 1.2.4.3 CIRCUITS AA AND AB, SIGNAL GROUND AND PROTECTIVE GROUND SHALL BE CONNECTED TO THE DC10E CIRCUIT LN AB (GND).
 - 1.2.4.4 CIRCUIT CD, DATA TERMINAL READY SHALL BE CONNECTED TO THE DC10E CIRCUIT LN DATA DATA TRM RDY EIA.
 - 1.2.4.5 CIRCUIT CB, CLEAR TO SEND, SHALL BE CONNECTED TO THE DC10E CIRCUIT LN CLR TO SND EIA.
 - 1.2.4.6 CIRCUIT CE, RINGING INDICATOR SHALL BE CONNECTED TO THE DC10E CIRCUIT LN RSTRN DETCTD EIA.
 - 1.2.4.7 THIS INFORMATION IS DESCRIBED IN FIGURE 2-8-G OF THE DC10 MANUAL,

1.2.5 THE DATASET AS SUPPLIED BY THE TELEPHONE COMPANY MUST HAVE THE FOLLOWING OPTIONS, FOR SATISFACTORY OPERATION:

2.5.1 AUTOMATIC ANSWER MUST BE PRESENT,

2.5.2 INITIATE DISCONNECT MUST BE PRESENT,

2.5.3 RESPOND TO DISCONNECT MUST BE PRESENT,

2.5.3 IF THE DATASET IS A 103E OR 103G, THEN "CB-CF INDICATION COMMON" MUST BE PRESENT,

1.2.6 THE "DTR OS" SWITCH ON THE CONTROL PANEL OF THE DC10 MUST BE IN THE ON (UP) POSITION AT ALL TIMES.

1.3 FUNCTIONS PROVIDED BY THE SOFTWARE:

1.3.1 INITIALIZATION:

WHEN THE MONITOR IS STARTED (OR RESTARTED), EACH DC10E LINE WILL BE INTERROGATED FOR THE PRESENCE OF A CARRIER. IF NO CARRIER IS PRESENT, THE DATASET WILL BE HUNG UP. IF A CARRIER IS PRESENT, THE DATASET WILL BE LEFT ENABLED. IN EITHER CASE, THE STATE OF THE CARRIER FLAG IS REMEMBERED IN CORE.

1.3.2 RESPONSE TO RINGING:

WHEN A LINE RINGS, LOCATION "STATES" WILL BE CHECKED FOR THE ABSENCE OF BIT 34, UNLESS INHIBITED BY BIT 34 OF STATES, DATA TERMINAL READY WILL BE SET FOR THIS LINE, CAUSING THE CALL TO BE ANSWERED BY THE DATASET. A FIFTEEN-SECOND COUNT WILL BE STARTED, SO THAT THE CALL MAY BE ABANDONED IF NO CARRIER IS RECEIVED AFTER THAT TIME. (THE RIGHT HALF OF LOCATION STATES MAY BE SET TO AN OCTAL NUMBER "N" BY THE MONITOR COMMAND "SCHEDULE N" TYPED AT THE OPERATOR'S CONSOLE.)

1.3.3 RESPONSE TO CARRIER-ON:

WHEN A CARRIER IS RECEIVED ON A LINE THE RECEIPT OF A "CONTROL-C" CHARACTER WILL BE SIMULATED. THERE WILL NOT BE AN AUTOMATIC LOGIN OPERATION IN THE INITIAL SYSTEM.

1.3.4 RESPONSE TO CARRIER-OFF:

WHEN A CARRIER-OFF SIGNAL IS RECEIVED, ANOTHER "CONTROL-C" WILL BE SIMULATED. THERE WILL NOT BE AN AUTOMATIC DETACH OR LOGOUT OPERATION IN THE INITIAL SYSTEM.

1.4 IMPLEMENTATION:

THE DATA STRUCTURES ASSOCIATED WITH THE DATA-SETS ARE DESCRIBED IN SUBROUTINES COMMON, OLSINT AND MONGEN. THERE ARE NO CONDITIONAL ASSEMBLIES ASSOCIATED WITH THE DC10E CODE, BUT TABLE SPACE WILL BE SAVED IF NO DC10E IS PRESENT.

2.2 UVO'S

2.2.1 TEMPORARY FILE STORAGE FOR JOB UVO, TMPCOR (44)

THE "TMPCOR" UVO IS USED TO ENABLE A JOB TO LEAVE SEVERAL SHORT FILES IN CORE FROM THE RUNNING OF ONE USER PROGRAM OR CUSP TO THE NEXT. THESE FILES MAY BE REFERRED TO BY A THREE CHARACTER FILE NAME, AND ARE UNIQUE TO EACH JOB, I.E. A JOB CAN ONLY REFERENCE ITS OWN FILES. ALL FILES ARE ALWAYS DELETED WHEN A JOB IS KILLED.

EACH FILE APPEARS TO THE USER AS ONE DUMP MODE BUFFER. THE ACTUAL SIZE OF A TEMPORARY FILE, THE NUMBER OF TEMPORARY FILES A USER CAN HAVE, AND THE TOTAL CORE SPACE A USER CAN TIE UP ARE PARAMETERS DETERMINED AT MONGEN TIME. ALL TEMPORARY FILES RESIDE IN A FIXED AREA IN THE MONITOR, BUT THE SPACE IS DYNAMICALLY ALLOCATED AMONG DIFFERENT JOBS AND THE SEVERAL DIFFERENT FILES OF ANY GIVEN JOB.

THE PRIMARY PURPOSE OF THE TEMPORARY STORAGE SYSTEM IS FOR SHORT CONTROL FILES, E.G. CCL FILES, TO LIVE IN CORE, THEREBY SPEEDING UP RESPONSE TIMES AND REDUCING DISK OPERATIONS. ACCORDINGLY, SHOULD A PROGRAM ATTEMPT TO WRITE A FILE WHEN THERE IS INSUFFICIENT SPACE, EITHER IN THE ENTIRE BUFFER AREA OR BECAUSE THE USER HAS EXCEEDED HIS QUOTA, THE UVO GIVES AN ERROR RETURN. THE CUSP CAN THEN WRITE THE DATA AS A SHORT DISK FILE. SIMILARLY, SHOULD A PROGRAM FAIL TO FIND A FILE UPON READING IT, IT WILL GET AN ERROR RETURN AND CAN THEN LOOKUP A SHORT DISK FILE.

IT IS VERY IMPORTANT TO REALIZE THE TEMPORARY NATURE OF THESE FILES. FOR EXAMPLE, UPON WRITING, THE OLD FILE IS DELETED BEFORE CHECKING FOR SPACE FOR A NEW VERSION. THE OLD FILE COULD BE LOST WITHOUT A NEW ONE REPLACING IT. ALSO, THERE CAN BE NO GUARANTEE THAT FILES WILL FIT IN CORE.

THE TMPCOR UVO IS NOT INTENDED TO REPLACE A FUTURE, MORE GENERAL, DEVICE INDEPENDENT SERVICE ROUTINE FOR "CORE". HOWEVER, THE SPACE TAKEN UP BY DEVICE DATA BLOCKS, ETC., IN THAT MORE GENERAL ROUTINE WOULD REPRESENT UNNECESSARY OVERHEAD FOR EXTREMELY SHORT DATA, SUCH AS CCL COMMAND FILES.

FORMAT OF TEMPORARY FILE STORAGE UVO.

```
CALL AC, [SIXBIT /TMPCOR/]      ;CALLI INDEX=44
;ERROR RETURN
;NORMAL RETURN
```

C(AC) MUST ALWAYS BE SET UP BY THE USER PROGRAM PRIOR TO EXECUTING THE UVO, IT IS CHANGED BY THE UVO AND RETURNS A VALUE THAT DEPENDS ON THE PARTICULAR FUNCTION PERFORMED.

C(AC) = XWD CODE,BLOCK

```
BLOCK:  XWD      NAME,0      ;NAME IS FILE NAME
        IOWD     BUFLN,BUFFER ;USER BUFFER AREA (ZERO FOR NO BUFFER)
```

CODE=0 -- GET FREE SPACE

THE IS THE ONLY FORM OF THE TEMP UVO THAT DOES NOT USE A TWO WORD PARAMETER BLOCK, C(AC) WOULD ORDINARLY BE SET TO ZERO FOR THE GET FREE SPACE UVO, THE USER PROGRAM ALWAYS GETS A NORMAL RETURN (UNLESS THE SYSTEM DOES NOT HAVE THE TEMP UVO), C(AC) IS SET TO THE NUMBER OF WORDS OF FREE SPACE AVAILABLE TO THE USER,

CODE=1 -- READ FILE

IF THE SPECIFIED FILE NAME IS NOT FOUND, C(AC) IS SET TO THE NUMBER OF FREE WORDS OF SPACE AVIALABLE FOR TEMP FILES, AND THE ERROR RETURN IS TAKEN,

IF THE FILE IS FOUND, C(AC) IS SET TO THE LENGTH OF THE FILE IN WORDS, AND AS MUCH OF THE FILE AS WILL FIT IS COPIED INTO THE USERS BUFFER, THE USER CAN CHECK FOR TRUNCATION BY COMPARING C(AC) WITH BUFLN UPON SUCCESSFUL RETURN FROM THE TEMP UVO,

CODE=2 -- READ AND DELETE FILE

THIS IS THE SAME AS CODE=1, EXCEPT THAT IF A FILE WAS FOUND IT IS ALSO DELETED AND ITS SPACE RECLAIMED,

CODE=3 -- WRITE FILE

IF THERE IS ALREADY A FILE OF THE SPECIFIED NAME, IT IS DELETED AND ITS SPACE IS RECLAIMED.

THE REQUESTED SIZE OF THE FILE IS SPECIFIED BY BUFLN. IF THERE IS NOT ENOUGH SPACE TO WRITE THE ENTIRE FILE, NOTHING IS WRITTEN, C(AC) IS SET TO THE NUMBER OF FREE WORDS OF SPACE AVAILABLE TO THE USER, AND THE ERROR RETURN IS TAKEN.

IF THERE IS ENOUGH SPACE, THE FILE IS WRITTEN. C(AC) IS SET TO THE AMOUNT OF SPACE LEFT AFTER THE FILE HAS BEEN WRITTEN AND THE NORMAL RETURN IS TAKEN. FILES ARE ALWAYS FILLED UP WITH ZEROS TO THE NEXT EVEN MULTIPLE OF THE BLOCK LENGTH (TMPBL). THIS EVEN LENGTH IS READ BACK IN.

CODE=4 -- READ DIRECTORY

THE ERROR RETURN IS NEVER TAKEN.

C(AC) IS SET TO THE NUMBER OF DIFFERENT FILES IN THE JOB'S TEMPORARY FILE AREA. IN ADDITION, AN ENTRY IS MADE FOR EACH FILE IN THE USER BUFFER AREA UNTIL THERE IS NO MORE SPACE OR ALL FILES HAVE BEEN LISTED. THE USER PROGRAM CAN CHECK FOR TRUNCATION BY COMPARING C(AC) UPON RETURN WITH BUFLN.

DIRECTORY ENTRY FORMAT

XWD NAME,SIZE INAME=FILE NAME, SIZE =FILE LENGTH IN WORDS.

CODE=5 -- READ AND CLEAR DIRECTORY

THIS IS THE SAME AS CODE=4 EXCEPT THAT ANY FILES IN THE JOB'S TEMPORARY STORAGE AREA ARE ALSO DELETED AND THEIR SPACE RECLAIMED.

THIS UUD IS EXECUTED BY THE LOGOUT CUSP.

IMPLEMENTATION

MASTER DIRECTORY

THIS IS A TABLE JOBN+1 ENTRIES LONG.

JBTMP: XWD FREE, IDLE
JBTTM1: XWD SPACE, LINK

:
:
:

MREE = NO. OF FREE BLOCKS IN MONITOR BUFFER AREA
IDLE = LINK TO FIRST FREE BLOCK OR 0 IF NO FREE BLOCKS
SPACE = NO OF FREE BLOCKS REMAINING IN JOBS QUOTA
LINK = LINK TO FIRST BLOCK OF FIRST FILE OF JOB, 0 IF NONE.

IDLE BLOCK FORMAT

XWD 0, LINK
REPEAT TMPBL, <0
>

LINK = LINK TO NEXT BLOCK ON IDLE CHAIN, 0 IF NO MORE.

USER BLOCK FORMAT

XWD NAME, LINK
BLOCK TMPBL USER DATA OR ZERO FILL.

NAME = USER FILE NAME,
LINK = LINK TO NEXT BLOCK IN THIS FILE OR NEXT FILE OF THIS USER

IF A FILE IS SEVERAL BLOCKS LONG, EACH BLOCK HAS THE FILE NAME,
A LINK OF 0 INDICATES NO MORE DATA IN THE FILE, AND NO MORE FILES
FOR THIS USER.

THEREFORE, A FILE ENDS WHEN ITS LAST BLOCK HAS A ZERO LINK, OR
WHEN IT LINKS TO A FILE OF DIFFERENT NAME.

MONITOR BUFFER AND PARAMETERS

TMPBUF: BLOCK TMPBKS=<TMPBL+1> BUFFER AREA FOR ALL FILES.

TMPBKS IS THE NUMBER OF BLOCKS THE STORAGE AREA IS COMPUTED.
IT IS COMPUTED BY MACRO DURING THE ASSEMBLY OF COMMON.
TMPBL IS A PARAMETER IN S,MAC.

TABLE OF CONTENTS

SYMBOLIC PARAMETER DEFINITIONS - APPEAR IN A SEPERATE FILE NAMED DSKPAR,MAC, THEY DEFINE ALL TABLE AND DISK BLOCK LAYOUTS AND ARE THE SOLE SOURCE OF THAT SPECIFICATION, IT SEEMS BETTER TO HAVE ONLY ONE PLACE FOR SUCH DOCUMENTATION WHICH MUST BE CORRECT RATHER THAN 2 PLACES WHICH CAN DIFFER,

1. IMPLEMENTATION POLICY AND IMPLEMENTATION GOALS

2. ACCUMULATOR USAGE

3. SEQUENCING OF OPERATIONS

4. UO2 FLOW IN UO2CON

```
ENTER  
LOOKUP  
INPUT CLOSE  
OUTPUT CLOSE  
INIT
```

5. UO₂ FLOW IN FILTER

LOOKUP
ENTER
INPUT
OUTPUT

6. GLOSSARY

1. IMPLEMENTATION POLICY IMPLEMENTATION GOALS

1. TRY TO MAKE UUO'S RESTARTABLE AT ANY TIME
 - A. ESPECIALLY BETWEEN IO WAITS

- B. BETWEEN INSTRUCTIONS

UUO CODE MUST NOT MODIFY DATA BASE IN DDB UNTIL A PROCESS HAS REACHED SUCCESSFUL TERMINATION. SAME IDEA HOLDS FOR UUOCON AND UUO PROGRESS BITS.

2. MAKE CODE DEFENSIVE, FOR EXAMPLE INPUT TESTS THAT DATA IN DDB IS SELF CONSISTENT, IF POSSIBLE.

3. DON'T TRUST HARDWARE, BUT DEMAND THAT HARDWARE STATUS CORRESPOND TO COMPUTED EXPECTED STATUS OR REMEMBERED STATUS.

4. KEEP MAXIMUM AMOUNT OF DEVICE STATUS INFORMATION IN CORE.

- A. MAKES INITIAL DEBUGGING EASIER

- B. FACILITATES PROGRAM MAINTENANCE.

5. TRY TO MAKE AS MUCH DATA SWAPPABLE AS POSSIBLE INCLUDING MOST OF DATA IN OSKDDB'S

6. MAKE PROGRAM EASIER TO MAINTAIN BY

- A. SHARPLY DEFINED MODULES

- B. CONVENTIONAL CALLING SEQUENCES

V002
V002
V002
V002

1. DEFINE PJRST TO BE OPCODE(S,MAC) TO REPLACE PUSHJ POPJ PAIR AT END OF A SUBROUTINE INSTEAD OF USING JRST. JRST WILL REMAIN TO BE USED FOR TRANSFER OF CONTROL TO TAGS WHICH ARE NOT SUBROUTINES.

V002
V002
V002
V002
V002
V002

2. USE MACRO ISTOPCD ARG! INSTEAD OF HALT FOR HALTS. IN S,MAC DEFINE ARG AS AN OCTAL SYMBOL USE ONE HALT CODE PER EACH STOPCD, DEFINE STOPCD AS
ANY OF: HALT
UUO
JFCL

- C. ACCUMULATOR CONVENTIONS

2. ACCUMULATOR USAGE

2.1 INTER MODULE CONVENTION

V002 THE DISK SERVICE WILL BE DIVIDED INTO 20 OR SO MODULES. THESE
V002 MODULES WILL FOLLOW THE FOLLOWING SUBROUTINE CONVENTION WHEN
V002 CALLING EACH OTHER. SECTION 2.2 DESCRIBES TWO EXCEPTIONS WHICH
V002 ARE ALLOWED ONLY WITHIN MODULES.
WE DEFINITELY REQUIRE A MORE DISCIPLINED USE OF ACCUMULATORS
WITHIN THE MONITOR NOT ONLY TO REDUCE EXTRANEIOUS PUSH'S AND POP'S
BUT ALSO TO ENABLE ALL SUBROUTINES TO ASSUME INTEGRITY OF DATA
IN AC'S, THREE CLASSES OF ACCUMULATORS ARE DEFINED:

1. GLOBAL
2. TEMPORARY
3. PRESERVED

GLOBAL ACCUMULATORS SUCH AS THE CURRENT F,P,R
ALWAYS CONTAIN THE SAME TYPE OF INFORMATION. ONLY A SELECT
SET OF ROUTINES EVER EXPLICITLY MODIFIES THE CONTENTS OF
GLOBAL AC'S. GLOBAL ACS ARE IMPLICIT ARGUMENTS TO MANY ROUTINES.

TEMPORARY ACCUMULATORS SUCH AS CURRENT T,T1, ETC., ARE USED FOR
WORKING STORAGE AS WELL AS BEING THE STANDARD PLACE TO PASS
ARGUMENTS AND RETURN VALUES.

PRESERVED ACCUMULATORS FORM A NEW AND MUCH NEEDED CLASS.
PRESERVED AC'S MAY BE USED AS DESIRED AFTER BEING SAVED. THEIR
INTEGRITY IS ASSURED AS ALL SYSTEM SUBROUTINES WILL USE A
COMMON SET OF ROUTINES TO SAVE AND RESTORE THESE AC'S. THEY
WILL NOT BE USED TO RETURN VALUES, HOWEVER THEY MAY BE USED
TO PASS ARGUMENTS WHEN THE QUANTITIES ARE THE TYPE OF THING WHICH
WANT TO STAY AROUND ACCROSS A NUMBER OF SUBROUTINE CALLS.

SUBROUTINES SAV1, SAV2, SAV3 AND SAV4 WILL BE USED TO PRESERVE
1, 2, 3 OR 4 OF THE COMMON PRESERVED AC'S. PRESERVED AC'S MUST BE
USED IN ORDER, THAT IS IF ONE IS REQUIRED P1 IS USED, IF TWO
ARE REQUIRED P1, P2 ARE USED AFTER CALLING SAV1, SAV2 RESPECTIVELY.
THE STANDARD POPJ P, OR JRST CPOPJ1 RETURNS WILL RESTORE ALL
OF THE PRESERVED AC'S UPON EXIT RELIEVING EACH SUBROUTINE
OF THAT TEDIOUS DUTY.

V003 THE NAMES OF ALL SUBROUTINES SATISFYING THESE CONVENTIONS WILL
V003 CONTAIN SIX CHARACTERS, WHILE VIOLATORS OF CONVENTION (SEE 2.2)
V003 WILL BE GIVEN 5 OR FEWER CHAR NAMES. THIS MAKES IT CLEAR TO
V003 THE READER WHEN HE SEES A PUSHJ WHAT IS WHAT WITHOUT GOING TO
V003 THE SUBROUTINE.

EXAMPLE OF AC SAVING ROUTINE AND USE

```
SUBRI   JSP T3,SAV2
        JRST CPOPJ1
```

```
SAV2:   PUSH P,P1
        PUSH P,P2
        PUSHJ P,(T3)
        JRST ,+2
        AOS = 2(P)
        POP P,P2
        POP P,P1
        POPJ P,
```

V002 NO SUBROUTINE WILL "POP UP MORE THAN ONE LEVEL" ON A RETURN.
 V002 TPOPJ AND TPOPJ1 MAY BE USED ONLY FOR POPPING OFF DATA (RATHER
 V006 THAN A RETURN). THUS THE PROGRAM FLOW IS ALWAYS APPARANT
 V006 TO THE READER BECAUSE IT ALWAYS RETURNS IMMEDIATELY AFTER
 V006 PUSHJ OR ONE LOCATION AFTER IT IF SUBROUTINE CAN GIVE A SKIP RETURN.
 NO SUBROUTINE WILL PASS ARGUMENTS OR RETURN VALUES
 ON THE PUSH DOWN LIST, NO SUBROUTINE WILL
 LEAVE THE PUSHDOWN LIST IN A DIFFERENT CONDITION
 OR DIFFERENT DEPTH THAN WHEN IT WAS CALLED.
 (EXCEPT OF COURSE SUCH ROUTINES AS SAV1...SAV4,
 CPOPJ, CPOPJ1, TPOPJ, AND TPOPJ1 WHICH EXIST
 SOLELY FOR THE PURPOSES OF HANDLING THE PUSH DOWN LIST,

2.2 INTRA MODULE CONVENTIONS

V002 BECAUSE THE ABOVE CONVENTIONS DO USE UP INSTRUCTIONS (PUSH'S AND
 V002 POP'S AND MOVE T,P1 ETC.) AND PUSHDOWN LIST SPACE, THE
 V002 FOLLOWING TWO EXCEPTIONS ARE ALLOWED:
 V003 (THESE SUBROUTINES ARE FLAGGED BY GIVING THEM FIVE OR FEWER
 SYMBOLS IN THEIR NAMES,)

V002 A. A SUBROUTINE (AND ALL THE ONES IT CALLS) MAY BE DESIGNED
 V002 TO RESPECT THE CONTENTS OF SPECIFIED TEMPORARY ACS, RESPECT
 V002 MEANS THAT A SUBROUTINE (AND ALL THE ONES IT CALLS) EITHER DO
 V002 NOT CHANGE THE CONTENTS OF AN AC (IT MAY OR MAY NOT BE AN
 V002 ARGUMENT) OR IT PUSH'S IT BEFORE MODIFICATION AND POP'S IT
 V002 BEFORE RETURN. WHEN THIS IS THE CASE THE COMMENTS AT THE
 V002 BEGINNING OF THE SUBROUTINE WILL SAY:
 V002 "WITH THIS SUB, AND ALL THE ONES IT CALLS RESPECT THE CONTENTS
 V002 OF TEMP ACS T1,T3," - FOR EXAMPLE

V003 B. A SUBROUTINE MAY RETURN A VALUE IN A PRESERVED AC (SO THAT
 V003 THE AC IS NOT PRESERVED), THIS EXCEPTION WILL ALSO BE
 V003 CLEARLY STATED AT THE BEGINNING OF A SUBROUTINE, THIS TECH-
 V003 NIQUE WILL BE USED INFREQUENTLY AND WILL BE USED FOR SETTING
 V003 UP A PRESERVED AC FOR A RELATIVELY GLOBAL QUANTITY WITHIN
 V003 A MODULE,

V003 ALL JRSY'S WILL BE TO TAGS DOWN PAGE, EXCEPT LOOPS. THUS FLOW
 V003 GOES DOWN THE PAGE, AND THE READER MAY START AT THE BEGINNING
 OF THE CODE AND READ THE PROGRAM WITHOUT BECOMING CONFUSED
 ABOUT THE PROGRAM FLOW.

ACCUMULATOR USAGE

	OLD NAME	NEW NAME	NEW ASSIGNMENT	
	IOS	S	0	
?	PDP	P	1	?
?	ITEM	U	2	?
?	PROG	R	3	GLOBAL
?	DEV DAT	F	4	
?	DAT	C	5	?
INTERRUPT AND UUO LEVELS	TAC	T	6	TEMPORARY
	TAC1	T1	7	
	TEM	T2	10	
?	DSER	T3	11	?
?	UCHN	UCHN	12	GLOBAL
?	UUO	UUO	13	
INTERRUPT AND UUO LEVELS	AC1	P1	14	?
	AC2	P2	15	"PRESERVED"
	AC3	P3	16	
?	BUFWRD	P4	17	

V004 TYPING CONVENTIONS:

V004 ONE TAB INSTEAD OF ONE SPACE BETWEEN INSTR. AND AC

V004 MULTI-LINE COMMENTS WILL BE INDICATED BY ONE SPACE

V004 AFTER THE SEMI COLON ON ALL BUT THE FIRST LINE.

V004 SUBROUTINE WILL BE PRECEDED WITH A DESCRIPTION OF

V004 FUNCTION, ARGS, AND VALUES, THE WORD "SUBROUTINE"

V004 WILL BE THE FIRST WORD ON THE FIRST LINE.

V004 TAGS WHICH APPEAR FIRST ON A PAGE AND THEREBY

V004 LOOK LIKE SUBROUTINES WILL BE INDICATED

V004 OTHERWISE BY A COMMENT STARTING AT LEFT

V004 MARGIN STARTING WITH WORD "HERE".

V004 MOST TAGS WILL BE PRECEDED BY A FULL LINE COMMENT

V004 STARTING WITH "HERE TO ... " TO DESCRIBE WHAT

V004 THE CODE IS ABOUT TO DO OR "HERE WHEN ... " TO

V004 DESCRIBE THE CONDITIONS WHICH CAUSED CONTROL TO

V004 GOT TO THE TAG

V004 THE INSTRUCTION OF A NON-SKIP SUBROUTINE RETURN WILL

V004 BE INDENTED 2 SPACES SO THE READER WILL

V004 BE ABLE TO TELL SUCH SUBROUTINES WHICH HAVE 2

V004 RETURNS.

V004 ALL SUBROUTINES WILL BE PRECEDED BY COMMENTS STARTING AT LEFT MARGIN

V004 WITH "SUBROUTINE TO ...", ALONG WITH DESCRIPTION OF ARGS

V004 ALSO ANY IMPORTANT OVERVIEW COMMENTS,

V004 ALL TAGS WHICH ARE LOOPS WILL BE PRECEDED BY A FULL LINE COMMENT

V004 "LOOP TO ..." DESCRIBING WHAT THE LOOP IS DOING

V004 IF THERE ARE ANY TAGS (VIOLATIONS OF JRST DOWN PAGE) WHICH ARE TRANSFERRED

V004 TO FROM FURTHER DOWN THE PAGE, SHALL INDICATE THIS BY A PRECEDING

V004 FULL LINE COMMENT "BACK HERE TO ... "

3. SEQUENCING OF OPERATIONS

THE OPERATIONS OF THE FILE SYSTEM WILL BE CAREFULLY DESIGNED SO THAT A SYSTEM CRASH AT ANY TIME WILL NOT LEAVE THE DISK IN A STATE WHICH WILL CAUSE MORE INFORMATION TO BE LOST. THUS THE ORDER OF WRITING DISK BLOCKS OF FILES WHICH DESCRIBE THE FILE STRUCTURE IS IMPORTANT (MFD, UFD, SAT, RIB). ALSO IMPORTANT IS THE ORDER IN WHICH CORE MEMORY LOCATIONS ARE UPDATED AND CHANGED. AN ATTEMPT WILL BE MADE TO ALLOW A JOB TO BE STOPPED (CONTROL C) OR RESCHEDULED AT ANY TIME DURING DISK IO OR BETWEEN ANY TWO INSTRUCTIONS. THE NO SCHEDULE, SCHEDULE MACRO WILL BE USED AROUND GROUPS OF INSTRUCTIONS FOR WHICH NO SCHEDULING (AND, THEREFORE STOPPING OF THIS JOB) CAN OCCUR. SOME DATA LOCATIONS ARE CHANGED AT UUD AND INTERRUPT LOCATIONS. THE NUMBER OF SUCH LOCATIONS SHALL BE MINIMIZED AND SHALL BE CLEARLY LABELLED.

THE DISK SERVICE WILL BE PROGRAMMED SO THAT IT WILL BE ABLE TO RECOVER FROM ANY CONDITION IN WHICH THE USER TYPED CONTROL C AND STARTED HIS PROGRAM OVER AGAIN. TO ASSIST IN THIS, EACH ACCESS TABLE ENTRY (ONE PER ACTIVE OR DORMANT FILE) AND EACH DOB (ONE PER ACTIVE FILE-USER PAIR) WILL HAVE A SIMPLE STATE CODE IN IT, RATHER THAN BITS, SO THAT A SIMPLE DISPATCH ON PREVIOUS STATE CODE WHEN AN EVENT OCCURS WILL MAKE SURE THAT ALL POSSIBILITIES ARE ACCOUNTED FOR. IF ANY SEQUENCE OF INSTRUCTIONS (NO IO WAIT) MUST BE EXECUTED WITHOUT INTERRUPT THEN THE NOSCHEDULE, SCHEDULE MACRO WILL BE USED.

SEQUENCING OF DISK BLOCK WRITES

THIS PROBLEM BECOMES MORE DIFFICULT BECAUSE THE OPTIMIZATION CODE WILL NOT NECESSARILY WRITE BLOCKS IN THE ORDER IN WHICH THEY ARE QUEUED. THE PROBLEM BECOMES EVEN MORE COMPLEX WHEN DIFFERENT SPEED DEVICES ARE PART OF THE SAME FILE STRUCTURE (E.G., DRUM AND BRYANT DISK). HOWEVER A REQUEST TO WRITE A GIVEN BLOCK FOLLOWED BY A REQUEST TO READ THE SAME BLOCK WILL ALWAYS OCCUR IN FIRST COME FIRST SERVE ORDER.

ORDER OF READING, WRITING, AND READ PAUSE WRITE OF BLOCKS

- <> MEAN POSSIBLE REPEATED READS OR WRITES. EXIT FROM LOOP NOT NECESSARILY AT BOTTOM.
- [] MEAN MAY BE UNNECESSARY BECAUSE OF RETRIEVED INFORMATION IN CORE. THE REASON IS INDICATED IN A SECOND SET OF BRACKETS.

V003 4. FILE, UNIT, CHANNEL, CONTROLLER STATUS

V003 I - IDLE
V003 SW - SEEK WAIT - POSITIONING DUE TO SEEK UUD, OF NO DATA
V003 TRANSFER AFTER
V003 S - SEEK
V003 PW - POSITION WAIT
V003 P - POSITION
V003 TW - TRANSFER WAIT
V003 T - TRANSFERRING

V003 WAIT MEANS FILE IS IN SEEK/POSITION QUEUE FOR UNIT OR TRANSFER
V003 QUEUE FOR CHANNEL

V003 NOT ALL ENTITIES CAN BE IN ALL STATES:

V003		FILE	UNIT	CHANNEL	KONTROLLER
V003	I	I	I	I	I
V003	SW		SW		
V003	S		S		
V003	PW	PW	PW		
V003	P	P	P		
V003	TW	TW	TW		
V003	T	T	T	B	B

V003 B STANDS FOR BUSY AND HAPPENS WHEN A DATA TRANSFER

V003 IF A UNIT IS IN SW, ONLY ONE FILE CAN BE IN QUEUE
V003 AND IT IS LEFT IN IDLE STATE, THE ONLY WAY
V003 A UNIT CAN GET INTO SEEK WAIT IS IF THE CONTROLLER
V003 IS BUSY WHEN A USER DOES A SEEK UUD, SUBSEQUENT
V003 SEEKS OR POSITIONS FOR THE SAME OR DIFFERENT FILES
V003 ON THE SAME UNIT WILL CAUSE THE SEEK/POSITION
V003 QUEUE FOR THE UNIT (ONLY ONE FILE WHEN UNIT IN SW)
V003 TO BE CLEARED),

```

ARGUMENTS TO FNDFIL

- A. SEARCH SPECIFICATION (LIST OF STR TO BE SEARCHED IN ORDER)
- B. JOB NUMBER (TO GET SOFTWARE WRITE-LOCK)
- C. FILE NAME
- D. EXTENSION
- E. PROJECT-PROGRAM NUMBER
- F. LOOKUP, ENTER, CHANGE NAME
- G. ADDRESS OF DEVICE DATA BLOCK

VALUES FROM FNDFIL

- A. OK RETURN (CORE BLOCKS CREATED AND INITIALIZED)
 - IF FOUND (LOOKUP AND ENTER)
 - NOT FOUND(ENTER, CHANGE NAME)
- B. ERROR RETURN (CORE BLOCKS NOT NECESSARILY SET UP, CALLER DOES NOT HAVE TO DELETE)
 - 1. CAN'T FIND FILE (ON LOOKUP)
 - 2. USER CAN'T CREATE IN THIS UFD (ENTER)
 - 3. USER CAN'T READ, UPDATE, SUPERSEDE THIS FILE BECAUSE OF ITS STATE
 - 4. PRIVILEGES DO NOT ALLOW LOOKUP, ENTER, CHANGE NAME
 - 5. FOUND FILE ON CHANGE NAME
- C. SETS UP CORE BLOCKS IF OK RETURN
 - 1. PROJECT PROGRAMMER NUMBER WITHIN SYSTEM BLOCK[PPB]
 - 2. USER FILE DIRECTORY WITH FILE STRUCTURE BLOCK[NMB]
 - 4. ACCESS BLOCK WITHIN NAME WITHIN PROJ PROG WITHIN SYSTEM BLOCK [ACC]
 - 5. SECOND HALF OF ACCESS BLOCK [AKB]

OPERATION OF FNDFIL

- A. FNDFIL IS ONLY CREATOR AND DELETER OF CORE BLOCKS (ACCESS, NAME, PROJ-PROG, UFD BLOCKS)
- B. SO FNDFIL DOES NOT CREATE CORE BLOCKS FOR LOOKUP NOT FOUND
- C. BUT DOES FOR ENTER NOT FOUND
- D. FNDFIL ALSO CHECKS PRIVILEGES AND DELETES CORE BLOCKS IF IT WISHED ON ERROR DEVACC=0 IS FLAG THAT ACCESS BLOCK IS DELETED ON ERROR
- E. FNDFIL SETS STATE OF ACCESS BLOCK ON INCREASES READ COUNT, ETC SO
- F. FNDFIL INITIALIZES ALL LOCATIONS IN ANY CORE BLOCKS IT CREATES.
- G. FNDFIL RETURNS ERROR CODES ON ALL ERROR RETURNS; THESE ARE PASSED BACK TO USER
- H. FNDFIL LEAVES RIB IN MONITOR BUFFER ONLY IF IT HAD TO READ IT [IOSMBF SET]

FLOW FOR FNDFIL CALLED BY LOOKUP, SEARCH, ENTER, RENAME

AN ACCESS BLOCK CAN BE IN EXACTLY ONE OF THE FOLLOWING STATES WHEN ENCOUNTERED BY FNDFIL: BECAUSE OF THE RESTRICTIONS ON ENTER, MOST OF THE TIME THERE CAN BE AT MOST ONE ACCESS BLOCK WITH A GIVEN FILE NAME (AND FILE STRUCTURE, PROJ, PROG AND EXTENSION), THE EXCEPTIONS ARE THAT R AND S MAY OCCUR SIMULTANEOUSLY IN TWO DIFFERENT ACCESS BLOCKS, ALSO AN ARBITRARY NUMBER OF EXTRA ENTRIES MAY BE MARKED FOR DELETION (K) BECAUSE THEY HAVE BEEN SUPERCEDED, BUT SOME SLOW READERS ARE STILL READING OLDER VERSIONS, THESE ACCESS BLOCKS HOWEVER ARE NOT SEEN BY FNDFIL SINCE THEY ARE REMOVED FROM THE RING OF ACCESS BLOCKS FOR THE NAME BLOCK WHEN THEY ARE MARKED FOR DELETION, FINALLY IF THE PROJECT-PROGRAMMER NUMBER HAS MORE THAN ONE FILE BY THE SAME NAME IN DIFFERENT FILE STRUCTURES, THERE WILL BE A SEPARATE ACCESS BLOCK FOR EACH

AN ACCESS ENTRY	LOOKUP SEARCH	ENTER (CREATE, SUPERCEDE) CREATE USE REMEMBER KEEP LOOKING(S)	RENAME (SEARCH FOR NEW NAME IF DIFF.) OK ERROR
N=NON EXISTANT FILE	ERROR	CREATE	OK
D=DORMANT	USE	USE	ERROR
R=1 OR MORE READERS(MAYBE ANOTHER S)	USE REMEMBER FOR POSSIBLE ERROR	REMEMBER KEEP LOOKING(S)	ERROR
C=BEING CREATED	KEEP LOADING	ERROR	ERROR
S=SUPERSEDING (MAYBE ANOTHER R)	KEEP LOOKING(R)	ERROR	ERROR
UR=BEING UPDATED AND READ	USE	ERROR	ERROR
K=MARKED FOR DELETION(IE SUPERSEDED)	(NOT SEEN BY FNDFIL)		

IN ORDER TO SAVE DISK SEEKS, FNDFIL REMEMBERS RECENT FILE NAMES ALONG WITH THE PROJECT PROGRAMMER NUMBERS AND FILE STRUCTURES IN WHICH THEY WERE FOUND.

THIS ASSOCIATIVE CORE INFORMATION HAS A RATHER COMPLEX STRUCTURE IN ORDER TO SPEED UP SEARCHES THROUGH IT, THE LISTS ARE AS FOLLOWS:

THE SYSTEM HAS A LIST OF RECENTLY ACCESSED PROJECT-PROGRAMMER NUMBERS [SYSPPB-PPBSYS], EACH PROJECT PROGRAMMER NUMBER BLOCK [PPB] HAS TWO LISTS:

- A UFO BLOCK [UFB] FOR EVERY FILE STRUCTURE IN WHICH THE PROJECT-PROGRAMMER NUMBER HAS A UFO [PPBUFB-UFBPPB]
- AND A NAME BLOCK [NME] FOR EVERY NAME WITH THIS PROJECT PROGRAMMER NUMBER (INDEPENDENT OF FILE STRUCTURE)[PPBNME-NMEPPB]

EACH NAME BLOCK HAS AN ACCESS BLOCK[ACC], LIST WITH AN ENTRY FOR EVERY ACTIVE FILE WITH THAT PROJECT PROGRAMMER NUMBER AND NAME, [NMBACC-ACCNMB]

IN ORDER TO ELIMINATE FRUITLESS SEARCHES,
THE PROJECT PROGRAMMER NUMBER BLOCK HAS A BIT FOR EACH
OF THE UP TO 14 ON-LINE FILE STRUCTURES WHICH
SAY WHETHER UPD EXISTS FOR THE PROJECT-PROGRAMMER NUMBER
OR NOT OR WHETHER WE DON'T KNOW YET, SIMILARLY THE
NAME BLOCK [NMB] HAS A BIT FOR EACH OF UP TO 14
ON-LINE FILE STRUCTURES WHICH SAY WHETHER FILE EXISTS
FOR THE PROJECT PROGRAMMER NUMBER OR NOT OR WHETHER WE DON'T
KNOW YET.

FLOW FOR FILE STRUCTURE UUD - STRUUD

CALL:

MOVE AC,[XWD N,LOC]
CALL AC,[SIXBIT ,STRUUD,] OR CALLI AC,50

N IS THE NUMBER OF WORDS IN THE ARGUMENT LIST STARTING AT
LOCATION LOC. FOR FIXED LENGTH ARGUMENT LISTS, N MAY BE 0.

THE FIRST WORD SPECIFIES THE FUNCTION REQUESTED.

FUNCTION= 0 FOR SETSRC
1 FOR DEFFST
2 FOR LOKFST
3 FOR REMFST

SETSRC DEFINES THE FILE STRUCTURE SEARCH LIST FOR THE JOB

NOTE: THE USER MAY DETERMINE HIS CURRENT FILE STRUCTURE SEARCH LIST BY USING THE JOBSTR UUO. HE MAY UNLINK HIMSELF FROM A FILE STRUCTURE BY LEAVING IT OFF THE NEW FILE STRUCTURE SEARCH LIST. THE USER MAY SPECIFY HIS PROJECT LIBRARY OR SYS TO BE INCLUDED IN HIS FILE STRUCTURE SEARCH LIST. PROJECT LIBRARY MUST BE FILE STRUCTURE NAME DSK FOR LEVEL D, AND MUST BE HIS PROJECT NUMBER AND PROGRAMMER NUMBER 0. MAXIMUM NUMBER OF FILE STRUCTURES, NOT INCLUDING PROJECT LIBRARY OR SYS, IS 9.

ARGUMENTS: THREE WORD BLOCKS:

FIRST WORD = SIXBIT FILE STRUCTURE NAME LEFT JUSTIFIED
SECOND WORD = PROJECT, PROGRAMMER NUMBER
THIRD WORD: BIT 0=1 IF SOFTWARE WRITE PROTECTION REQUESTED
BIT 1=1 IF NO CREATE ON THIS FILE STRUCTURE REQUESTED
(UNLESS THE SPECIFIC FILE STRUCTURE IS OPENED)

ERROR RETURNS: 1 OR MORE FILE STRUCTURES DON'T EXIST
1 OR MORE FILE STRUCTURES SINGLE ACCESS ONLY
TOO MANY ENTRIES

TASKS: IF ARGUMENT LIST OUT OF BOUNDS, TO ERR
VERIFY THAT ALL FILE STRUCTURES IN THE USER'S SEARCH LIST EXIST
IF ANY FILE STRUCTURE IS SINGLE ACCESS AND MOUNT COUNT NO 0, TO ERR
FOR EACH FILE STRUCTURE ON THE NEW SEARCH LIST
IF THE FILE STRUCTURE IS NOT ON THE USER'S OLD FILE
STRUCTURE SEARCH LIST, INCREMENT THE MOUNT COUNT
FOR EACH FILE STRUCTURE NO LONGER ON THE SEARCH LIST,
DECREMENT THE MOUNT COUNT
MAKE THE NEW LIST THE SEARCH LIST
EXIT

DEFSTR DEFINES A FILE STRUCTURE FOR THE SYSTEM

ARGUMENTS: FILE STRUCTURE NAME
 BITS
 PACK ID / DRIVE PAIRS

ERROR RETURNS: 1 OR MORE DRIVES NOT AVAILABLE
 CANT REDEFINE BECAUSE MOUNT COUNT NOT 0
 FILE STRUCTURE ALREADY BEING MOUNTED

TASKS: IF ARGUMENT LIST OUT OF BOUNDS, TO ERR
 IF THE FILE STRUCTURE IS ON THE PHYSICAL DEVICE LIST
 IF N GR 3 (NEW DEFINITION), TO ERR
 IF THE MOUNT COUNT NOT 0, TO ERR
 IF DRIVES ARE BEING MOUNTED
 CHANGE STATE TO MOUNTED
 SET MOUNT COUNT TO 1
 EXIT
 (REDEFINITION) SET NEW FLAGS
 SET MOUNT COUNT TO 1
 EXIT
END

IF ANY DRIVE IN THE FILE STRUCTURE IS ALREADY IN A FILE
STRUCTURE OR DOWN, TO ERR

SET FLAGS

APPEND THE FILE STRUCTURE NAME TO THE PHYSICAL DEVICE LIST

APPEND THE FILE STRUCTURE NAME TO THE DISK DEVICE LIST

APPEND THE PACK ID'S TO THE PHYSICAL DEVICE LIST

PUT THE PACK ID AND FILE STRUCTURE NAME IN THE TABLE
FOR EACH DRIVE

PUT EACH DRIVE IN BEING MOUNTED STATE

SET THE FLAG TO REREAD THE HOME BLOCK FOR EACH DRIVE

SET THE MOUNT COUNT TO 0

EXIT

LOKSTR LOCKS OUT FURTHER LOOKUP'S, ENTER'S, AND INIT'S

ARGUMENTS: FILE STRUCTURE NAME

TASKS: SET FLAG TO LOCK OUT FURTHER LOOKUP'S, ENTER'S AND INIT'S
EXIT

REMSTR REMOVES A FILE STRUCTURE FROM THE SYSTEM

ARGUMENTS: FILE STRUCTURE NAME

TASKS: IF THE FILE STRUCTURE DOESN'T EXIST, EXIT
DELETE THE FILE STRUCTURE NAME FROM ALL FILE STRUCTURE SEARCH LISTS
DELETE THE FILE STRUCTURE NAME FROM THE PHYSICAL DEVICE LIST
DELETE THE PACK ID'S FROM THE PHYSICAL DEVICE LIST
DELETE THE PACK ID'S AND FILE STRUCTURE NAME FROM THE
TABLE FOR EACH DRIVE IN THE FILE STRUCTURE
PUT THE DRIVES IN A NOT IN A FILE STRUCTURE STATE
EXIT

FORM OF MOUNT UUO:

```
MOVE    A,[XWD NUMWRD,LOC]
CALL    A,[SIXBIT ,MOUNT,] OR CALL A,
```

NUMWRD=THE NUMBER OF WORDS IN THE ARGUMENT LIST
LOC=ADDRESS OF THE FIRST ARGUMENT

THE ARGUMENT LIST HAS THE FOLLOWING FORM:

```
LOC/    FILE STRUCTURE NAME
LOC+1/  STATUS BITS
LOC+2/  FIRST PACK ID
LOC+3/  FIRST DRIVE
LOC+4/  SECOND PACK ID
LOC+5/  SECOND DRIVE
...
```

IF NUMWRD LESS THAN OR EQUAL TO 2, THERE ARE NO PACKS LISTED. THIS WILL
BE THE CASE IF THE FILE STRUCTURE IS BEING MOUNTED OR IS ALREADY MOUNTED.

```

2. OVERVIEW

FILTST IS A MACRO SOURCE PROGRAM WHICH DEFINES A MACRO LEVEL LANGUAGE INTENDED AS A CONVENIENT MEDIUM IN WHICH TO WRITE PROCEDURES WHICH EXERCISE AND TEST THE FILE HANDLING CAPABILITIES OF THE PDP-10 TIME-SHARING MONITOR. IN ORDER THAT THIS MACRO LANGUAGE POSSESS THE GENERALITY AND FLEXIBILITY OF THE STANDARD USER MODE TECHNIQUES FOR DOING FILE I/O AT ASSEMBLY LEVEL, THE LANGUAGE IS NECESSARILY QUITE CLOSE TO STANDARD USER-MODE I/O, AND IS INTENDED TO BE USED BY SOMEONE THOROUGHLY FAMILIAR WITH THE STRUCTURE AND CALLING SEQUENCES OF THE STANDARD UUOS. HOWEVER, IT IS INTENDED TO RELIEVE THE PROGRAMMER OF ATTENTION TO BIT AND WORD LEVEL DETAIL AND TO PERMIT HIM TO SPECIFY REASONABLY COMPLEX DISK OPERATIONS WITH SIMPLICITY AND COMPACTNESS AT BOTH SOURCE AND OBJECT LEVELS.

FILTST IS NOT A "CONDITIONAL LANGUAGE, THAT IS, IT IS NOT INTENDED THAT FILE OPERATIONS BE "TRIED TO SEE WHAT HAPPENS", WITH SUBSEQUENT ACTION DEPENDING UPON A PREVIOUS RESULT. RATHER, IT IS INTENDED THAT THE USER WHO PREPARES ANY TEST PROCEDURE HAVE AN UNDERSTANDING OF EXACTLY WHAT SHOULD HAPPEN WHEN THE PROCEDURE IS EXECUTED. FILTST WILL ATTEMPT TO PROVIDE DIAGNOSTIC INFORMATION WHENEVER A RESULT IS CONTRARY TO AN INDICATED EXPECTATION.

THE USE OF FILTST TYPICALLY INVOLVES THE PREPARATION OF AN AUXILIARY TEXT FILE IN THE FILTST LANGUAGE CONSISTING OF A NUMBER OF INDEPENDENT DEFINITIONS OF TEST PROCEDURES (WHICH MAY CALL EACH OTHER RECURSIVELY TO ANY DEPTH) AND A LIST OF WHICH OF THESE PROCEDURES ARE TO BE EXECUTED AND IN WHAT ORDER. THIS AUXILIARY FILE IS THEN ASSEMBLED WITH FILTST AND THE RESULTING SINGLY BINARY FILE IS LOADED AND EXECUTED. THE RUNNING TO COMPLETION OF THIS EXECUTION WITH NO UNUSUAL OUTPUT, INDICATES THAT ALL OF THE TESTS SPECIFIED IN THE AUXILIARY FILE RAN WITH SPECIFIED EXPECTATIONS BEING MET. ANY ERROR CONDITION, UNEXPECTED RETURN FROM A UUO, OR UNEXPECTED VALUE RETURNED BY THE MONITOR WILL RESULT IN AN ERROR MESSAGE AT THE CONSOLE. THE USER IS THEN FREE TO PROCEED FROM THE ERROR CONDITION, IGNORING IT, OR ATTEMPT TO ANALYZE THE PROBLEM BEFORE CONTINUING.

(2. CONT'D)

WHEN SOME ERROR DOES OCCUR, USUALLY BECAUSE SOME EXPECTATION HAS NOT BEEN MET, THE USER IS FACED WITH THE PROBLEM OF DETERMINING WHAT WENT WRONG. UNLESS THE TEST HAS RUN SUCCESSFULLY WITH THE SAME MONITOR BEFORE, THE FIRST QUESTION IS LIKELY TO BE: "HAVE I DISCOVERED A BUG IN THE DISK SERVICE, OR IS THERE A BUG IN MY TEST PROCEDURE?" UNFORTUNATELY, FILTST IS HARD PRESSED TO DETERMINE THE DIFFERENCE AND THE USER MUST RELY UPON ANALYSIS OF HIS PROCEDURES IN THE LIGHT OF WHAT HAPPENED. IT IS FILTST'S MAIN ORDER OF BUSINESS TO SHOW THE USER WHAT DID HAPPEN. THE ERROR TRACE PRINTED BY FILTST FOLLOWING ANY ERROR MESSAGE WILL DISCLOSE THE EXACT PATH TAKEN THROUGH THE USER'S NESTED PROCEDURES AND AT JUST WHICH STEP OF WHICH PROCEDURE THE ERROR OCCURRED. IT ALSO SHOWS THE NUMBER OF TIMES EACH PROCEDURE HAS BEEN CALLED SUCCESSFULLY (MORE DETAIL BELOW). IT IS HOPED THAT THIS INFORMATION AND A SOURCE LISTING OF THE AUXILIARY FILE OF PROCEDURE DEFINITIONS WILL BE SUFFICIENT IN MANY CASES FOR COMPLETE ANALYSIS OF THE PROBLEM. FOR THOSE CASES IN WHICH IT IS NOT SUFFICIENT, A COPY OF DDT IS LOADED WITH FILTST. ENOUGH OF FILTST'S INTERNAL STRUCTURE, USE OF ACS ETC, IS PRESENTED BELOW SO THAT DDT CAN BE USED EFFECTIVELY TO DISCOVER MORE ABOUT THE CAUSE OF ANY ERROR MESSAGE.

MORE GENERALLY, THE OPERATION OF "PREPARING THE AUXILIARY FILE OF TEST PROCEDURES" IS LIKELY TO BE THE EXPANDING OF ONE OR MORE GROWING PROCEDURE FILES. IT IS INTENDED THAT VARIOUS OPERATING VERSIONS OF FILTST, EACH CONTAINING ITS OWN SUB SET OF PROCEDURES, BE SAVED IN CORE IMAGE FORM AFTER BEING DEBUGGED, TO BE USED REPEATEDLY TO TEST THE CONTINUED INTEGRITY OF THE MONITOR'S DISK SERVICE WHENEVER CHANGES ARE MADE TO IT.

3. WRITING TEST PROCEDURES

TEST PROCEDURES IN THE FILTST LANGUAGE ARE USUALLY SHORT AND QUITE COMPACT, THEY CONSIST MAINLY OF MACRO CALLS, SOME OF WHICH TAKE ONE OR MORE SIMPLE ARGUMENTS, UPON RARE OCCASIONS IT IS ALSO CONVENIENT TO INCLUDE A FEW BASIC PDP-10 INSTRUCTIONS WHICH REFERENCE A SMALL SET OF ACCUMULATORS KNOWN TO BE AVAILABLE AND A FEW ADDRESSES WITH PREDICTABLE MNEMONICS,

TO THE EXTENT THAT PROCEDURES ARE COMPACT, THEY ARE VERY EASY TO WRITE; UNFORTUNATELY, THEY ARE CORRESPONDINGLY DIFFICULT TO UNDERSTAND WITH RESPECT TO OVERALL INTENT UNLESS GENEROUSLY COMMENTED, A RECOMMENDED CONVENTION WHICH RESULTS IN A CLEAN CREF LISTING FOR LATER USE DURING ERROR ANALYSIS, IS THAT COMMENTS APPEAR IN BLOCKS PRECEDING PROCEDURE DEFINITIONS RATHER THAN ON INDIVIDUAL SOURCE LINES WITHIN THE PROCEDURES. (COMMENTS ON LINES WITH MACRO CALLS ARE DELETED DURING ASSEMBLY. THIS IS TRUE BECAUSE IT IS FELT THAT A SOURCE-LIKE LISTING CONTAINING ONLY MACRO CALLS AND ARGUMENTS IS A MUCH MORE CONVENIENT TOOL FOR DEBUGGING THAN A LISTING IN WHICH MACRO EXPANSIONS ARE SHOWN. IN FACT SOME AMOUNT OF TROUBLE IS TAKEN TO AVOID ALL UNNECESSARY OUTPUT IN CREF LISTINGS.)

3.1 FILTST DATA BASE

SOME MONITOR UUO'S (EG, OPEN, LOOKUP, SEARCH, ENTER, RENAME) TAKE ARGUMENTS AND RETURN VALUES IN DATA BLOCKS WITHIN A JOBS LOW SEGMENT. A LARGE PART OF THE INTRICACY OF DOING DISK I/O IN USER MODE INVOLVES ESTABLISHING, SETTING, TESTING AND CLEARING THE RIGHT PARTS OF THESE UUO DATA BLOCKS. MANY OF THE FILTST MACROS EXIST FOR THE PURPOSE OF MAKING THIS JOB EASY. AS A COMPROMISE BETWEEN SIMPLICITY AND SIZE, THE FOLLOWING IMPLEMENTATION DECISIONS WERE REACHED:

1. THERE WILL BE A MAXIMUM NUMBER OF SOFTWARE CHANNELS WHICH ANY SINGLE JOB RUNNING FILTST CAN USE SIMULTANEOUSLY; THIS PARAMETER HAS BEEN ARBITRARILY SET AT FIVE (5) INITIALLY.
2. ALLOCATION OF CORE TO UUO DATA BLOCKS WILL NOT BE DYNAMIC; RATHER, SUFFICIENT DATA SPACE FOR THE MAXIMUM NUMBER OF SIMULTANEOUS CHANNELS WILL BE GENERATED AT ASSEMBLY TIME.

FOR EACH POTENTIALLY ACTIVE CHANNEL, THERE EXISTS IN FILTST'S LOW SEGMENT A BLOCK OF LOCATION CONSISTING OF THREE WORDS FOR USE WITH THE OPEN UUO, A SINGLE EXPANDABLE BLOCK (CURRENTLY SET AT TEN WORDS) FOR USE WITH ALL EXTENDED LOOKUP - SEARCH - ENTER - RENAME, UUOS, AND THREE OR MORE ADDITIONAL PARAMETER WORDS (TO BE EXPLAINED BELOW). THE GENERATION OF MNEMONICS AND MACROS FOR EACH OF THE WORDS IN THIS "PER-CHANNEL" DATA BASE IS CONTROLLED BY THE DEFINITION OF THE ARGS MACRO TO BE FOUND ON PAGE 4 OF A LISTING OF FILTST. IT IS INTENDED THAT ONLY THE DEFINITION OF THIS ARGS MACRO NEED BE CHANGED IN ORDER TO REARRANGE OR EXPAND THE ARRAYS OF ARGUMENTS AND VALUES WHICH ACCOMPANY THE UUOS. IN FACT, THE ONLY SOURCE LEVEL DIFFERENCE BETWEEN THE VERSION OF FILTST FOR LEVEL C DISK SERVICE AND THAT FOR LEVEL D DISK SERVICE, IS A REARRANGEMENT OF FIVE ENTRIES (ENTRIES FOUR THROUGH EIGHT) IN THE ARGS MACRO.

3.2 THE SETXXX AND SELXXX MACROS

FOR EACH WORD IN THE "PER-CHANNEL" DATA BASE, THERE IS A MACRO OF THE FORM SETXXX WHERE THE LAST THREE CHARACTERS MATCH SOME THREE CHARACTER MNEMONIC WITHIN THE DEFINITION OF ARGS. BY MEANS OF EACH OF THESE MACROS, THE CORRESPONDING LOCATION IN THE DATA BASE CAN BE "SET". IN ADDITION TO ONE DATA BLOCK FOR EACH CHANNEL, THERE IS ONE "JOB STANDARD" DATA BLOCK WHICH IS INTENDED TO CONTAIN DEFAULT ARGUMENTS TO BE USED ON ANY USER CHANNEL WHENEVER A REQUIRED ARGUMENT HAS NOT BEEN PREVIOUSLY SET. THE VARIOUS ENTRIES IN THIS "JOB STANDARD" DATA BLOCK ARE SET BY MEANS OF SELXXX MACROS. FOR EVERY SETXXX MACRO, THERE IS A CORRESPONDING SELXXX "SELECT" MACRO. SELXXX MACROS ARE CHANNEL INDEPENDENT, WHILE SETXXX MACROS ALWAYS APPLY TO SOME SPECIFIC "CURRENT" CHANNEL (AS DESCRIBED BELOW).

3.2.1 MACRO ARGUMENTS

WITH CERTAIN SPECIAL EXCEPTIONS, MACRO ARGUMENTS ARE TYPICALLY EITHER DECIMAL NUMBERS (IMMEDIATE MODE) OR CHARACTERS WHICH SPECIFY AN ADDRESS WHOSE CONTENTS COMPRISES THE ARGUMENT. IN THE CASE OF SETXXX AND SELXXX MACROS, OBSERVATION OF THE ARGS DEFINITION AND THE COMMENTS WHICH PRECEDE IT WILL REVEAL WHICH OF THE MACROS ARE IMMEDIATE AND WHICH TAKE ADDRESS, OR SPECIAL ARGUMENTS. AS A COMPROMISE BETWEEN GENERALITY AND SIMPLE USEFULNESS, THOSE DATA BASE ENTRIES WHICH REQUIRE ADDRESS ARGUMENTS (I.E., THOSE OF MORE THAN 18 BITS) ARE RESTRICTED TO A SET OF CHOICES GIVEN IN TABLES ON PAGE 8 OF FILTST. BY CONVENTION, A CHOICE IS MADE BY GIVING AS AN ARGUMENT TO A SETXXX OR SELXXX MACRO, JUST THE CHARACTERS FOLLOWING THE PERIOD IN LOCATION NAMES SHOWN IN THESE TABLES. THE TABLES CAN CERTAINLY BE EXPANDED, MODIFIED WITH DDT, OR PERHAPS (AS A POTENTIAL FUTURE FEATURE) SET CONVERSATIONALLY IN AN INITIALIZATION DIALOGUE.

3.3 THE SELCHN MACRO AND EXAMPLES

WITH THE EXCEPTION OF THE SELXXX MACROS WHICH MODIFY THE SINGLE CHANNEL INDEPENDENT DATA BASE, AND THE EXPECT MACRO (TO BE DESCRIBED BELOW) ALL MACROS PERTAIN TO SOME SOFTWARE CHANNEL. WHICH CHANNEL A MACRO PERTAINS TO IS NOT SPECIFIED IN THE MACRO CALL, BUT RATHER IS DETERMINED BY THE MOST RECENTLY EXECUTED SELCHN ("SELECT CHANNEL") MACRO. THIS IS SO THAT WHOLE PROCEDURES MAY BE WRITTEN INDEPENDENT OF A SOFTWARE CHANNEL NUMBER AND THEN CALLED AFTER AN APPROPRIATE SELCHN MACRO. SELCHN IS A SPECIAL MACRO WHICH "SELECTS" THE CHANNEL TO WHICH ALL SUBSEQUENT MACROS (AND THE UUOS THEY STIMULATE) WILL APPLY UNTIL THE EXECUTION OF ANOTHER SELCHN MACRO. SOME EXAMPLES MAY CLARIFY THE ABOVE DISCUSSION.

MACRO SEQUENCE

SELNAM A	SELECT FILENAME FILTSA AS THE CHANNEL INDEPENDENT DEFAULT FILENAME IN THE "JOB STANDARD" DATA BASE (6TH WORD)
SELCHN2	SET STRUCTURE NAME TO DPA0 IN DATA BASE FOR CHANNEL 2 (2ND WORD)
SETSTR A0	SET THE DIRECTORY NAME TO ZERO (TO USE CURRENT PJ, PG) STILL IN DATA BASE FOR CHANNEL 2.
SETDIR 0	(2ND WORD IN LOOKUP ETC, BLOCK = OR 5TH WORD IN CHANNEL DATA BASE)
SELCHN 0	SET THE NUMBER OF ARGUMENTS PASSED IN SUBSEQUENT LOOKUP ETC, UUOS TO 4
SETARG 4	IN CHANNEL 0 DATA BASE (4TH WORD)

IT CAN BE SEEN THAT BY MEANS OF SETXXX MACROS FOLLOWING SOME SELCHN MACRO, ANY ENTRY IN THE UUO DATA ARRAYS CAN BE SET FOR ANY CHANNEL. NOT ALL OF THE ENTRIES DEFINED IN THE ARGS MACRO HAVE BEEN EXPLAINED SUFFICIENTLY AT THIS POINT; A COMPLETE DESCRIPTION OF EACH APPEARS IN THE LIST OF MACROS IN APPENDIX I. ALSO, THE PURPOSE OF THE CHANNEL INDEPENDENT SELXXX MACROS HAS NOT YET BEEN SUFFICIENTLY EXPLAINED. READ ON.

3,4 OTHER DATA BASE MACROS

IN ADDITION TO THE SETXXX MACROS FOR SETTING ENTRIES IN THE "PER CHANNEL" DATA BASE, AND SELXXX MACROS FOR "SELECTING" ENTRIES IN THE "JOB STANDARD" DATA BASE, FIVE OTHER MACROS ARE USEFUL IN SETTING DATA BASE ENTRIES:

CLRVAL WILL CLEAR THE ENTIRE DATA BASE FOR A PARTICULAR CHANNEL (DEPENDING AS USUAL UPON THE MOST RECENT SELCHN MACRO). IF AN ARGUMENT IS SUPPLIED TO CLRVAL, IT IS A DECIMAL NUMBER SPECIFYING WHERE THE CLEARING OPERATION IS TO BEGIN. FOR EXAMPLE, CLRVAL 7 WILL CLEAR ALL OF THE EXTENDED ARGUMENTS IN THE CURRENT CHANNEL LKP-ENT-REN BLOCK, (I.E., IT WILL NOT CLEAR THE FIRST 7 WORDS - THREE IN THE OPEN BLOCK AND FOUR IN THE LKP-ENT-REN BLOCK. ANY SINGLE DATA BASE WORD CAN BE CLEARED BY GIVING 0 AS AN ARGUMENT TO THE APPROPRIATE SETXXX MACRO, NO MATTER WHAT TYPE OF ARGUMENT THE PARTICULAR MACRO USUALLY TAKES.

RSTEXT AND RSTPRT WILL CLEAR ALL BUT THE EXTENSION AND PROTECTION FIELDS RESPECTIVELY IN THE CORRESPONDING WORDS IN THE CURRENT CHANNEL DATA BASE, THAT IS, THEY WILL CLEAR ANY VALUES THE MONITOR MAY HAVE RETURNED IN OTHER FIELDS IN THESE WORDS.

THE FORSET MACRO IS USED TO "FORCE THE SETTING" OF SPECIFIC WORDS IN THE CURRENT CHANNEL DATA BASE USING THE CORRESPONDING WORDS IN THE JOB STANDARD DATA BASE AS A SOURCE. THE MACRO TAKES AN ARBITRARY LENGTH STRING OF ARGUMENTS ENCLOSED IN ANGLE BRACKETS AND SEPARATED BY COMMAS; EACH ARGUMENT IS ONE OF THE THREE CHARACTER MNEMONICS FOUND IN THE ARGS MACRO. FOR EXAMPLE, FORSET <ARG, DIR> WILL FORCE THE FIRST TWO WORDS IN THE LKP-ENT-REN BLOCK FOR THE CURRENT CHANNEL TO BE SET FROM THE JOB STANDARD DATA BASE WHICH WOULD PRESUMABLY HAVE BEEN SET PREVIOUSLY BY SELARG AND SELDIR MACROS. THE INTENTION OF THIS MECHANISM IS THAT PROCEDURES MAY BE WRITTEN INDEPENDENT OF PARTICULAR UFDS, FILENAMES, STRUCTURES, ETC., AND THEN CALLED (FROM WITHIN SOME OTHER PROCEDURE) AFTER APPROPRIATE SELXXX MACROS.

(3.4 CONT'D)

FINALLY (FOR THIS SECTION), THE INSURE MACRO IS IDENTICAL TO FORSET, EXCEPT THAT THE SPECIFIED DATA BASE ARGUMENTS ARE SET ONLY IF THEY HAVE NOT ALREADY BEEN SET (BY A SETXXX, FORSET OR INSURE MACRO) SINCE THE MOST RECENT RELEASE UO0 ON THE CURRENT CHANNEL. A RANDOM FACT WHICH BELONGS FURTHER ALONG IN THIS DOCUMENTATION BUT MIGHT CLARIFY THE USE OF THE INSURE MACRO IS THAT WHENEVER AN OPEN UO0 IS EXECUTED FOR A PARTICULAR CHANNEL, FILTST DOES AN AUTOMATIC

INSURE <MOD, STR, BUF>

AND BEFORE ANY UO0 WHICH REFERENCES THE LKP-ENT-REN BLOCK, FILTST DOES AN AUTOMATIC

INSURE <ARG, DIR, NAM, EXT, PRT>

(THIS DOES NOT IMPLY THAT THE USER CANNOT SET THE NUMBER OF ARGUMENTS FOR LKP-ENT-REN UO0S LESS THAN FOUR),

3.5

SPECIFYING EXPECTATIONS

SO FAR, THE ONLY MACROS DISCUSSED HAVE BEEN FOR MODIFYING AN IN CORE DATA BASE; NONE HAVE RESULTED IN INVOLVING THE MONITOR. FILTST PROCEDURES ARE INTENDED TO TAKE TWO PREPARATORY ACTIONS BEFORE EXECUTING ANY MACROS WHICH RESULT IN UO0S. THE FIRST OF THESE ACTIONS IS THE PREPARATION OF THE CHANNEL DATA BASE AS DESCRIBED ABOVE; THE SECOND IS THE PREDICTING OF EXPECTED RESULTS. A SINGLE MACRO, CALLED EXPECT, EXISTS FOR THIS PURPOSE.

EXPECT TAKES TWO ARGUMENTS EITHER OF WHICH MAY BE MISSING. THE FIRST OF THESE SPECIFIES RETURN EXPECTATIONS FOR ANY SUBSEQUENT UO0S WHICH HAVE MORE THAN ONE RETURN. THE ARGUMENT MAY BE A SINGLE CHARACTER FROM THE SET GIVEN BELOW, OR A DECIMAL NUMBER. IT IS INTERPRETED AS FOLLOWS:

ARGUMENT	INTERPRETATION
X	EITHER UO0 RETURN ACCEPTABLE
N	NORMAL (SKIP) RETURN EXPECTED
E	ERROR (FIRST) RETURN EXPECTED BUT
	ANY ERROR CODE IS ACCEPTABLE
<NUMBER>	ERROR (FIRST) RETURN EXPECTED AND
	ERROR CODE MUST BE <NUMBER>

THIS FIRST ARGUMENT TO EXPECT IS RELEVANT ONLY FOR SUBSEQUENT UO0S OF TWO RETURNS. SINGLE RETURN UO0S DO NOT REQUIRE THIS FORM OF EXPECTATION PREDICTION.

(3.5 CONT'D)

THE SECOND ARGUMENT TO EXPECT IS RELEVANT FOR ALL SUBSEQUENT UUOS. IT SPECIFIES THE EXPECTED STATES OF THE FIVE STATUS BITS RETURNED IN BIT POSITIONS 18 - 22 OF THE GETSTS UUO. UNLESS ERROR CHECKING IS SUPPRESSED FOR SOME REASON (AS IT USUALLY IS IN CASES WHERE A SINGLE PROCEDURE MACRO REQUIRES THE EXECUTION OF MORE THAN ONE UUO), A GETSTS IS DONE AFTER EVERY OTHER UUO, AND THE FOUR ERROR BITS PLUS THE END-OF-FILE BIT ARE CHECKED AGAINST EXPECTATIONS.

THE MACRO ARGUMENT MUST CONSIST OF STRING OF FIVE CHARACTERS, EACH OF WHICH MUST BE EITHER 0, 1 OR X, EACH CHARACTER CORRESPONDS TO ONE OF THE FIVE STATUS BITS (FROM LEFT TO RIGHT) WHERE 0 AND 1 SPECIFY THAT THE BIT MUST BE EITHER A ZERO OR A ONE, AND X SPECIFIES THAT EITHER ZERO OR ONE IS ACCEPTABLE FOR THAT BIT.

NOTICE THAT THE EXPECT MACRO IS CHANNEL INDEPENDENT, AND SPECIFIES EXPECTATION FOR ALL SUBSEQUENT UUOS, NO MATTER WHAT CHANNEL THEY ARE EXECUTED ON. IT IS INTENDED THAT EXPECT MACROS BE EXECUTED AS OFTEN AS EXPECTATIONS CHANGE. DURING MOST PARTS OF MOST PROCEDURES, THE EXPECTATIONS ARE LIKLY TO BE

EXPECT N,00000

ONE SUCH MACRO IS SUFFICIENT UNTIL SOME ERROR RETURN OR ERROR BIT IS TO BE EXPECTED, IF EITHER ARGUMENT TO AN EXPECT MACRO IS MISSING (I.E. BLANK), THE PREVIOUS EXPECTATIONS FOR THAT ARGUMENT ARE NOT ALTERED.

3,6 THE EXECUTE MACROS

ONCE THE DATA BASE FOR A PARTICULAR CHANNEL AND THE APPROPRIATE EXPECTATIONS HAVE BEEN ESTABLISHED BY MEANS OF SETXXX (OR SELXXX AND FORSET) AND EXPECT MACROS, IT IS THEN REASONABLE TO PROVOKE ACTION BY MEANS OF THE XCTXXX MACROS, WITH THE EXCEPTION OF INPUT AND OUTPUT WHICH ARE DESCRIBED IN DETAIL BELOW, THERE IS ONE SIMPLE XCT MACRO FOR EACH OF THE POSSIBLE UUOS, FOR THE UUOS OPEN (INIT IS NEVER USED), LOOKUP ENTER, RENAME, SEARCH, SEEK AND RELEASE, THE CORRESPONDING MACROS ARE XCTOPN, XCTLKP, XCTENT, XCTREN, XCTSRC, XCTSEK, AND XCTRLS. NONE OF THESE MACROS TAKE ARGUMENTS SINCE THE PROPER CHANNEL NUMBER IS DETERMINED BY THE MOST RECENT SELCHN MACRO, AND ALL OTHER PARAMETERS HAVE BEEN DETERMINED BY PREVIOUS PREPARATORY MACROS (AS DESCRIBED IN THE PARAGRAPHS ABOVE).

THE UUOS USETO, USETI AND CLOSE ARE ACCOMPLISHED BY XCTSTO, XCTSTI AND XCTCLS MACROS. THESE THREE MACROS MAY EACH TAKE A SINGLE NUMERIC ARGUMENT (INTERPRETED AS DECIMAL); TO SPECIFY THE RELATIVE BLOCK NUMBERS IN XCTSTO AND XCTSTI MACROS, AND TO OPTIONALLY SPECIFY THE ADDRESS FIELD OF THE CLOSE UUO (WHEREBY ONE SIDE OR THE OTHER OF A BI-DIRECTIONAL OPERATION CAN BE CLOSED).

EACH OF THESE XCTXXX MACROS GENERATES A PUSHT CALL TO A ROUTINE WHICH SETS UP AND EXECUTES FROM WITHIN THE ACS THE PROPER UUO FOR THE CURRENT CHANNEL, THEN PERFORMS ALL EXPECTATION CHECKING WITH ERROR MESSAGES AND DIAGNOSTIC OPERATIONS INVOKED AS APPROPRIATE AND FINALLY, TURNS OFF ANY STATUS BITS WHICH COME ON FOR THAT CHANNEL, AND RETURNS TO THE NEXT MACRO IN THE CURRENT PROCEDURE.

3.7 READ AND WRITE OPERATIONS

FOUR MACROS EXIST TO ALLOW EASY SPECIFICATION OF INPUT AND OUTPUT OPERATIONS. EACH OF THESE MACROS CAN RESULT IN AN ARBITRARY NUMBER OF INPUT OR OUTPUT UJOS BEING EXECUTED, THE FOUR MACROS ARE

REDNXT N, P - "READ NEXT" N WORDS; EXPECT DATA
PATTERN P.
WRTNXT N, P - "WRITE NEXT" N WORDS IN DATA PATTERN P.
REDSPC N, B, P - "READ SPECIFIC" N WORDS STARTING WITH
FIRST WORD OF RELATIVE BLOCK B;
EXPECT DATA PATTERN P.
WRTSPC N, B, P - "WRITE SPECIFIC" N WORDS STARTING
WITH FIRST WORD OF RELATIVE BLOCK B,
IN DATA PATTERN P.

THE ARGUMENT N IS GIVEN IN WORDS RATHER THAN BLOCKS SO THAT PARTIAL BLOCKS MAY BE READ AND WRITTEN. THE ARGUMENT B IS A (DECIMAL AS USUAL) RELATIVE BLOCK NUMBER IN THE CURRENT FILE. THE DATA PATTERN IS ALSO A DECIMAL ARGUMENT WHICH SHOULD BE A NUMBER BETWEEN 0 AND 255. THIS IS BECAUSE THE ARGUMENT SUPPLIED IS TRUNCATED TO 8 BITS, AND THEN REPRODUCED FOUR TIMES IN A 36 BIT WORD. THE RESULTING WORD IS WRITTEN (OR EXPECTED) IN A PARTICULAR POSITION IN EACH BLOCK OF THE FILE BEING WRITTEN OR READ. A DATA PATTERN ARGUMENT OF 0 IS A SPECIAL CASE SPECIFYING THAT DATA PATTERNS ARE NOT TO BE CHECKED UPON INPUT.

IT IS SOMETIMES USEFUL FOR SOME OR ALL OF THE ARGUMENTS TO RED OR WRT MACROS TO BE MISSING. TO ALLOW FOR THIS POSSIBILITY, THREE ADDITIONAL WORDS ARE PART OF EACH CHANNEL DATA BASE (AND THE JOB STANDARD DATA BASE). THEY ARE THE LAST THREE ENTRIES IN THE ARGS MACRO (NAMELY: NRB, XFW, AND PAT) AND STAND FOR "NEXT RELATIVE BLOCK" (TO READ OR WRITE), "TRANSFER WORDS" (I.E. NUMBER OF WORDS TO READ OR WRITE), AND "DATA PATTERN." THESE LOCATIONS ARE SET IN THE USUAL MANNER WITH SETXXX (AND SELXXX) MACROS AND ONE REFERENCED BY THE RED AND WRT MACROS WHENEVER (ONLY IF) THE CORRESPONDING ARGUMENTS WERE NOT SUPPLIED. FOR EXAMPLES, SOME OF THE MANY EQUIVALENT MACRO SEQUENCES TO ACCOMPLISH THE WRITING OF BLOCKS 3, 4, AND 5 OF A FILE IN DATA PATTERN 2 MIGHT BE:

WRTSPC		3*BL, 3, 2
	(OR)	
SETNRB		3
SETPAT		2
WRTSPC		3*BL
	(OR)	

(3.7 CONT'D)

SELNRB	3
SELXFW	3*BL
SELPAT	2
FORSET	<NRB, XFW, PAT>
WRTSPC	
(OR)	
SETPAT	2
XCTSTO	3
WRTNXT	3*BL
(ETC.)	

THE MECHANISM BY WHICH I/O IS ACCOMPLISHED DEPENDS UPON THE DATA MODE. PRIOR TO ANY XCTOPN, THE DATA MODE MUST HAVE BEEN SELECTED BY A SETMOD (OR SELMOD) MACRO. MOD IS ONE OF THE ENTRIES DECLARED IN THE ARGS MACRO TO HAVE UNUSUAL ARGUMENTS. BASICALLY, ALL I/O IS DONE IN EITHER BINARY (14) OR DUMP (17) MODE; HOWEVER, 3 DIFFERENT BINARY MODES ARE AVAILABLE: BINARY INPUT ONLY (BI), BINARY OUTPUT ONLY (BO), AND BINARY BOTH (BB). THE SYMBOLS BI, BO, BB AND DM (WHICH STANDS FOR DUMP MODE) ARE DEFINED IN FILTST TO BE USED AS THE SET OF ARGUMENTS TO CHOOSE AMONG FOR SETMOD AND SELMOD MACROS. ACTUALLY BB MODE CAN ALWAYS BE USED IN PLACE OF BI OR BO; THE ONLY DIFFERENCE IS THAT TWO BUFFER HEADERS ARE ESTABLISHED IN BB MODE (I.E. BOTH SIDES OF THE BUF ENTRY IN THE DATA BASE ARE SET).

IN BINARY MODE, DOUBLE BUFFERING IS ALWAYS USED (BUFFERS ARE ASSEMBLED INTO EACH PER-CHANNEL DATA BASE), AND THE USUAL OVERLAPPING OF I/O WITH COMPUTATION IS MAINTAINED.

IN DUMP MODE, WITH SPACE FOR TWO INPUT AND TWO OUTPUT BUFFERS AVAILABLE, EACH OPERATION IS AUTOMATICALLY BROKEN INTO SOME NUMBER (POSSIBLY ZERO) OF 512 WORD TRANSFERS FOLLOWED (POSSIBLY) BY ONE LAST TRANSFER OF LESS THAN 512 WORDS.

3.8 DEFINING PROCEDURES

THE REMAINING MACROS (IMPLEMENTED TO DATE) IN FILTST ARE USED FOR DEFINING AND CALLING TEST PROCEDURES.

ALL TEST PROCEDURES HAVE NAMES. THESE NAMES HAVE TWO PARTS EACH OF WHICH MAY BE ONE OR TWO CHARACTERS LONG; THE TWO PARTS ARE SEPARATED BY A COMMA. THIS CONVENTION OF TWO PART NAMES, CONTAINING NO MORE THAN FOUR CHARACTERS TOTAL, SEEMED A GOOD COMPROMISE BETWEEN THE NEED TO RECOGNIZE PROCEDURE FUNCTIONS EASILY FROM THEIR NAMES, AND THE NEED TO GENERATE UNIQUE SYMBOLS FOR EACH PROCEDURE. NO PARTICULAR CONVENTIONS ARE RECOMMENDED FOR NAMING PROCEDURES EXCEPT THAT NAMES SHOULD SUGGEST THE LIKELY "LEVEL" OF THE TEST PROCEDURE; THAT IS, SINCE PROCEDURES CAN CALL EACH OTHER RECURSIVELY, IT IS QUITE CONVENIENT TO WRITE AN EXPANDING SET OF GENERAL PURPOSE "INNER" PROCEDURES AND TO BUILD LEVELS OF "OUTER" PROCEDURES WHICH CALL THEM; NAMES SHOULD REVEAL AT LEAST WHICH OF THE PROCEDURES ARE OUTERMOST.

THE MACRO PROCED MUST BE THE FIRST IN ANY PROCEDURE, AND DEFINES ITS NAME; THE TWO ARGUMENTS TO PROCED ARE THE TWO PARTS OF THE PROCEDURE NAME, FOR EXAMPLE, AMONG THE SAMPLE PROCEDURES WRITTEN SO FAR FOR FILTST IS ONE WHICH BEGINS

PROCED MT, UB

THE MNEMONIC IS INTENDED TO SUGGEST "MAIN TEST" (MEANING OUTERMOST LEVEL), "UPDATE BACKWARDS," AS THE COMMENTS REVEAL, THIS PROCEDURE UPDATES MULTIPLE BLOCKS OF DECREASING RELATIVE BLOCK NUMBER. THE PROCED MACRO GENERATES THE CODE WHICH MAINTAINS THE ERROR TRACE PUSH DOWN STACK AND ENTRY COUNTS FOR THE PROCEDURE, AND GENERATES TWO SYMBOLS OF THE FORM

X,N1N2 AND C,N1N2

WHERE N1 AND N2 ARE THE TWO PARTS OF THE PROCEDURE NAME, THE FIRST SYMBOL IS THE PROCEDURE ENTRY POINT AND THE SECOND LABELS THE REGISTER WHERE CALLS TO THIS PROCEDURE ARE COUNTED. ALL PROCEDURES MUST END WITH THE MACRO ENDPR WHICH TAKES NO ARGUMENTS. BLOCKS WHICH BEGIN WITH PROCED AND END WITH ENDPR MAY BE INSERTED IN ANY ORDER WITHIN THE AUXILIARY FILE (ASSEMBLED WITH FILTST) SINCE CONTROL NEVER FALLS FROM ONE INTO THE NEXT.

3,9 CALLING PROCEDURES

TWO MACROS EXIST FOR CALLING PROCEDURES FROM WITHIN OTHER PROCEDURES. (A SEPARATE MECHANISM EXISTS FOR CALLING OUTERMOST PROCEDURES INITIALLY AS EXPLAINED BELOW.) THE MACRO CALLPR TAKES TWO ARGUMENTS WHICH, AS IN THE CASE OF PROCD, ARE THE TWO PARTS OF A PROCEDURE NAME. CALLPR SIMPLY GENERATES A PUSHJ TO THE ENTRY POINT X,N1N2.

A RELATED MACRO, RPCALL ("REPEAT CALL"), IS USED TO CALL PROCEDURES MORE THAN ONCE. IT TAKES A THIRD ARGUMENT WHICH IS A DECIMAL COUNT OF THE NUMBER OF TIMES TO CALL THE PROCEDURE. IF THIS ARGUMENT IS MISSING, THE VALUE IS TAKEN INSTEAD FROM THE CONTENTS OF YET ANOTHER WORD IN THE CURRENT CHANNEL DATA BASE; THIS WORD IS DEFINED BY THE MNEMONIC REP IN THE ARGS MACRO, AND IS SET AS USUAL BY MEANS OF THE SETREP (OR SELREP AND FORSET) MACROS.

RPCALL IS THE MEANS BY WHICH "LOOPS" ARE ACCOMPLISHED. ANY SEQUENCE OF MACROS TO BE INCLUDED IN A LOOP IS DECLARED TO BE A SEPARATE PROCEDURE AND CALLED THE APPROPRIATE NUMBER OF TIMES BY A RPCALL MACRO WITHIN SOME OTHER PROCEDURE. THE "TALLY" CONCEPT USUALLY ASSOCIATED WITH LOOPS IS OCCASIONALLY USEFUL WITHIN FILTST PROCEDURES; INCREMENT AND DECREMENT OPERATIONS WHEN NEEDED ARE ACCOMPLISHED BY MEANS OF DIRECT POP-10 INSTRUCTIONS AS FOLLOWS:

3,10 PROCEDURE STEPS WHICH ARE NOT FILTST MACROS:

SO FAR ALL DISCUSSION OF THE FILTST DATA BASE HAS INVOLVED SETTING LOCATIONS WITHIN IT. THESE LOCATIONS CAN BE REFERENCED, CHECKED, INCREMENTED, ETC., BY MEANS OF DIRECT POP-10 INSTRUCTIONS. FIVE ACCUMULATORS MAY BE OF INTEREST TO USERS WRITING TEST PROCEDURES:

ACCUMULATORS "A", "B" AND "C" ARE GUARANTEED TO BE PRESERVED BY ALL CODE GENERATED OR CALLED BY FILTST MACROS AND ARE THEREFORE AVAILABLE TO BE USED WITHIN TEST PROCEDURES. IF THE USER FEELS IT NECESSARY TO PRESERVE THESE ACS IN "INNER" PROCEDURES WHICH MIGHT USE THEM, PUSH AND POP INSTRUCTIONS CAN BE USED WITH ACCUMULATOR "P". FINALLY ACCUMULATOR "D" ALWAYS POINTS TO THE DATA BASE FOR THE CURRENT USER CHANNEL (SET BY THE MOST RECENT SELCHN MACRO); EACH OF THE MNEMONICS IN THE ARGS MACRO GENERATES A SYMBOL OF THE FORM RIBXXX WHICH WHEN INDEXED BY D WILL REFERENCE THAT PARTICULAR ENTRY IN THE CURRENT CHANNEL DATA BASE. ("RIB" WAS CHOSEN BECAUSE MANY, BUT NOT ALL, OF THE ENTRIES IN EACH DATA BASE CORRESPOND TO ENTRIES IN A FILES RETRIEVAL INFORMATION BLOCK.)

(3.10 CONT'D)

THUS, FOR EXAMPLE, THE INSTRUCTION SEQUENCE

```
MOVEI   A,5  
ADDMM   A,RIBNRB (D)
```

WILL ADD 5 TO THE "NEXT RELATIVE BLOCK" NUMBER IN THE CURRENT CHANNEL DATA BASE; THE NEW VALUE WILL BE USED WHEN THE NEXT REDSPC OR WRTSPC MACRO IS EXECUTED (PROVIDED ITS SECOND ARGUMENT IS MISSING IN THE CALL).

REGISTERS WITHIN THE "JOB STANDARD" DATA BASE MAY BE REFERENCED AS SYMBOLIC LOCATIONS USRXXX WHERE XXX MATCHES ANY MNEMONIC IN THE ARGS MACRO; (NO INDEX REGISTER IS USED IN REFERENCES TO LOCATIONS USRXXX).

3.11 THE TEST TABLE:

IN ADDITION TO A COLLECTION OF SEPARATE PROCEDURE DEFINITIONS IN NO PARTICULAR ORDER, THE AUXILLIARY FILE ASSEMBLED WITH FILTST MUST CONTAIN A TABLE WHOSE STARTING LOCATION IS TESTS AND WHOSE CONTENTS DEFINE THE ORDER IN WHICH THE OUTERMOST LEVEL OF TEST PROCEDURES ARE TO BE CALLED WHEN FILTST IS RUN.

ONE MACRO, CALLED DO, IS USEFUL FOR SPECIFYING ENTRIES IN THE TESTS TABLE. ITS FIRST TWO ARGUMENTS ARE THE TWO PARTS OF THE NAME OF SOME PROCEDURE TO BE EXECUTED, AND ITS THIRD ARGUMENT, IF PRESENT, IS A DECIMAL COUNT OF THE NUMBER OF TIMES THAT PROCEDURE IS TO BE EXECUTED BEFORE THE NEXT ENTRY IN THE TESTS TABLE IS SEEN. THE TESTS TABLE IS THEREFORE A LIST OF DO MACROS AND MUST BE FOLLOWED BY A WORD CONTAINING ZERO. WHEN THE ZERO WORD IS ENCOUNTERED DURING EXECUTION, THE LIST OF TESTS IS REPEATED FROM THE BEGINNING. MORE INFORMATION ABOUT THE STRUCTURE AND USE OF THE TESTS TABLE CAN BE FOUND IN THE FILTST LISTING ON THE PAGE WHEREON THE SYMBOL DOTEST IS DEFINED. USE OF THE DO MACRO RESULTS IN THE GENERATION OF COMMENTS IN THE LISTING WHICH NUMBER THE ENTRIES IN THE TEST TABLE FOR EASY IDENTIFICATION DURING DEBUGGING.

THE ONLY OTHER CONSTRUCTION WHICH MUST BE PART OF THE AUXILLIARY FILE ASSEMBLED WITH FILTST ARE THE TWO LINES:

```
LSTECT : XWD ZCHAIN,0  
        AND  
END START
```

THE FIRST OF THESE SPECIFIES THE END OF A CHAIN LIST THROUGH WHICH THE ENTRY COUNTS OF ALL PROCEDURES ARE LINKED (SO THAT THEY MAY BE CLEARED AT APPROPRIATE TIMES). THE FILTST STARTING ADDRESS IS START, DEFINED NEAR THE END OF THE MAIN FILTST FILE.

4. FILTST OPERATION

4.1 THE ERROR TRACE

UPON ANY ERROR MESSAGE (AND WHENEVER THE W COMMAND IS TYPED - SEE BELOW) A PRINTOUT OF THE CURRENT TRACE STACK IS GENERATED. THE TRACE SHOWS WHAT STEP OF WHAT PROCEDURE WAS BEING EXECUTED WHEN THE ERROR OCCURRED, AND BY EXACTLY WHAT PATH CONTROL HAD REACHED THAT POINT. THE TRACE BEGINS WITH THE CURRENT INDEX INTO THE TESTS TABLE (PRINTED IN OCTAL SINCE THE DO MACRO NUMBERS THE ENTRIES IN OCTAL IN THE LISTING). A DECIMAL NUMBER IS GIVEN IN PARENTHESIS WITH EACH PROCEDURE NAMED IN THE TRACE; IT IS THE NUMBER OF TIMES THAT PROCEDURE HAS BEEN CALLED SINCE THE TESTS TABLE INDEX WAS INCREMENTED TO ITS PRESENT VALUE. THAT IS, THE ENTRY COUNTS FOR ALL PROCEDURES ARE CLEARED WHENEVER ANY ENTRY IN THE TESTS TABLE HAS BEEN COMPLETED. (SINCE ENTRY COUNTS ARE PART OF THE "PURE" PROCEDURE DEFINITIONS IN FILTST'S HIGH SEGMENT, THIS FEATURE IS MOST USEFUL WHEN ONLY A SINGLE JOB IS USING THE HIGH SEGMENT,) AS AN EXAMPLE, THE TRACE:

5 RD,DL -- 9 (1) / OP,RD -- 3 (2)

INDICATES THAT CONTROL IS CURRENTLY AT STEP 3 OF PROCEDURE OP,RD (AND THAT THIS IS THE SECOND CALL TO OP,RD). IT SAYS THAT OP,RD WAS CALLED BY STEP 9 OF PROCEDURE RD,DL (DURING THE FIRST CALL TO RD,DL), AND THAT RD,DL WAS CALLED DIRECTLY AS A RESULT OF THE DO MACRO COMPRISING THE FIFTH ENTRY IN THE TESTS TABLE. NOTE THAT ONLY THOSE PROCEDURE STEPS WHICH ARE FILTST MACROS ARE COUNTED AS STEPS; IN DETERMINING WHAT LINE OF A PROCEDURE CORRESPONDS TO WHAT STEP, ONE MUST NOT COUNT ANY LINES COMPRISING BASIC PDP-10 INSTRUCTIONS.

ANY FURTHER INFORMATION REQUIRED FOR ANALYSIS OF THE PROBLEM (IF THE TRACE WAS PRODUCED AS THE RESULT OF SOME PROBLEM) MUST BE OBTAINED THROUGH DDT WHICH IS TYPICALLY LOADED WITH FILTST.

4.2 FILTST COMMANDS

WHEN FILTST IS RUNNING, IT ACCEPTS A SET OF SINGLE CHARACTER COMMANDS WHICH MAY BE TYPED AT ANY TIME. THE CONSOLE INPUT BUFFER IS CHECKED FOR THE PRESENCE OF COMMAND CHARACTERS AFTER EVERY UUO IS EXECUTED. SOME COMMANDS ARE PROCESSED WITHOUT STOPPING THE TEST SEQUENCE IN PROGRESS; OTHERS INTERRUPT THE RUNNING OF FILTST IN CONVENIENT WAYS. THE PAGE OF THE FILTST LISTING ON WHICH THE SYMBOL COMTAB IS DEFINED DESCRIBES HOW NEW COMMANDS MAY BE ADDED; THOSE WHICH HAVE BEEN IMPLEMENTED TO DATE ARE DESCRIBED IN THE PARAGRAPHS BELOW, AND SUMMARIZED IN APPENDIX LL.

AS MENTIONED ABOVE, THE COMMAND W (MNEMONICS FOR "WHERE" ARE WE?) MAY BE TYPED AT ANY TIME; WHEN CONTROL RETURNS FROM THE NEXT UUO, THE TRACE STACK WILL BE PRINTED SO THAT, BY REFERENCE TO THE AUXILIARY FILE LISTING, THE USER CAN DETERMINE HOW FAR THE TEST SEQUENCE HAS PROGRESSED. ERROR MESSAGES CONSIST OF AN ERROR NUMBER OF THE FORM EXX AND THE TEXT OF THE MESSAGE. OUTPUT CAN BE ABBREVIATED TO THE ERROR NUMBER ALONE BY MEANS OF THE A COMMAND; THE "LONG" FORM CAN BE RE-ENABLED BY MEANS OF THE L COMMAND.

4.3 FILTST AND DDT

IT IS INTENDED THAT DDT BE LOADED WITH FILTST FOR INTERACTIVE INVESTIGATION OF OBSCURE ERRORS. IT IS FURTHER INTENDED THAT A DDT BREAKPOINT BE INSERTED AT LOCATION BREAK IN FILTST'S LOW SEGMENT. INSERTING A BREAKPOINT AT THIS LOCATION, WHICH IS OTHERWISE INITIALIZED TO CONTAIN A POPJ INSTRUCTION, ENABLES TWO OTHER USEFUL FILTST COMMANDS. FILTST CAN BE MADE TO EXECUTE A PUSHJ TO BREAK, WHICH WILL THEN ENTER DDT VIA THE BREAKPOINT, AT TWO PREDICTABLE TIMES. THE "SPACE" COMMAND (THE CHARACTER "SPACE") WILL CAUSE THE PUSHJ TO BE EXECUTED AS SOON AS THE COMMAND IS PROCESSED - THAT IS, AS SOON AS THE NEXT UUO IS EXECUTED. THE S (MNEMONIC FOR "STOP") COMMAND WILL CAUSE THE PUSHJ TO BREAK WHEN THE TEST PROCEDURE INDICATED IN THE CURRENT POSITION OF THE TESTS TABLE IS COMPLETE. THAT IS, S WILL STOP FILTST WITH NO PROCEDURE IN PROGRESS AS IT IS JUST ABOUT TO BEGIN ANOTHER "OUTERMOST" PROCEDURE. NEITHER THE "SPACE" NOR THE S COMMAND HAVE ANY EFFECT IF A BREAKPOINT HAS NOT BEEN PLACED AT LOCATION BREAK.

4.4 AFTER AN ERROR MESSAGE

EXCEPT AFTER AN ERROR MESSAGE, FILTST COMMANDS ARE PROCESSED WHENEVER THEY ARE TYPED, BUT NONE ARE EVER REQUIRED. AFTER AN ERROR MESSAGE HOWEVER, AT LEAST ONE OF THE "ACTION TYPE" COMMANDS IS REQUIRED AND IS WAITED FOR. IN THE TABLE OF COMMANDS (COMTAB IN FILTST LISTING), TWO COMMANDS ARE CURRENTLY FLAGGED AS ACTION COMMANDS; ONE OR THE OTHER OF THESE MUST BE TYPED THE USER AFTER ANY ERROR. ONE IS THE "SPACE" COMMAND WHICH CAUSES DDT TO BE ENTERED (AS DESCRIBED ABOVE) SO THAT THE ERROR MAY BE INVESTIGATED; THE OTHER IS THE "C" (FOR "CONTINUE") COMMAND WHICH CAUSES FILTST TO PROCEED AND IGNORE THE ERROR. IT IS INTENDED TO BE POSSIBLE TO CONTINUE FROM ANY ERROR THAT MIGHT OCCUR WITH INTERNAL CONDITIONS SET AS THEY WOULD HAVE BEEN HAD THE ERROR NOT OCCURRED. TYPING C MAY WELL RESULT IN OTHER RELATED ERRORS BEING DETECTED, BUT AT LEAST WILL NOT LOOP ON A SINGLE ERROR. IT IS HOPED THAT WHEN AN ERROR DOES OCCUR, THE ERROR TRACE STACK (PRINTED AUTOMATICALLY), WILL BE SUFFICIENT INFORMATION FOR ANALYSIS OF THE PROBLEM, (IN CONJUNCTION WITH THE FILTST LISTING), AND THAT TYPING "C" WILL RESULT IN A SUCCESSFUL "CONTINUE" SUCH THAT FURTHER ERRORS WHICH OCCUR WILL BE SEPARATE SITUATIONS FOR LATER ANALYSIS. THE "C" COMMAND HAS NO EFFECT IF TYPED WHILE FILTST IS RUNNING. ALL CHARACTERS WHICH ARE NOT COMMANDS (INCLUDING CARRIAGE RETURN AND LINE FEED) ARE IGNORED.

4.5 DDT TECHNIQUES

THE FILTST LISTING SHOULD BE CONSULTED FOR COMPLETE INFORMATION ON INTERNAL STRUCTURE, ESPECIALLY PAGE 3 WHEREON THE IMPURE DATA BASE IS DEFINED. A FEW REGISTERS IN THE DATA BASE WERE INCLUDED SPECIFICALLY FOR DEBUGGING PURPOSES; THEIR SPECIAL FUNCTIONS ARE EXPLAINED MORE FULLY HERE THAN IN THE LISTING COMMENTS.

ACCUMULATORS OF SPECIAL INTEREST DURING DEBUGGING ARE:
P - THE CONTROL PUSH-DOWN POINTER
TR - THE TRACE STACK PUSH-DOWN POINTER
D - POINTER TO THE DATA BASE FOR THE CURRENT USER CHANNEL
U - ALWAYS CONTAINS THE LAST UDO EXECUTED

LOCATION TRLAST CONTAINS THE NAME OF THE LAST PROCEDURE SUCCESSFULLY COMPLETED (LOADED BY EVERY ENDPR MACRO). THE TWO HALVES OF THE PROCEDURE NAME ARE IN LEFT JUSTIFIED 7-BIT ASCII IN THE TWO HALVES OF THE WORD - A RATHER INCONVENIENT FORMAT FOR DDT, UNFORTUNATELY.

(4.5 CONT'D)

THREE LOCATIONS IN EACH CHANNEL DATA BASE (NO NEED FOR THEM TO BE PART OF "JOB STANDARD" DATA BASE) ARE OF SPECIAL INTEREST FOR DEBUGGING:

LOCATION CHNCNT CONTAINS IN ITS LEFT HALF A SET OF BITS, ONE BIT FOR EACH OF THE POSSIBLE UUOS, SHOWING WHICH UUOS HAVE BEEN EXECUTED ON THIS CHANNEL. IN THE RIGHT HALF, THERE IS A COUNT OF THE NUMBER OF UUOS WHICH HAVE BEEN EXECUTED ON THIS CHANNEL (TO ACCOUNT FOR THE FACT THAT SOME UUOS MAY HAVE BEEN EXECUTED SEVERAL TIMES). CHNCNT IS INITIALIZED TO ZERO JUST BEFORE ANY OPEN UUO IS EXECUTED ON THAT CHANNEL SO THAT THE CHANNEL HISTORY REMAINS EVEN AFTER A RELEASE UUO.

LOCATION CHNARG HAS A BIT POSITION FOR EACH OF THE ENTRIES IN THE ARCS MACRO; THAT IS, FOR EVERY DATA BASE ENTRY FOR WHICH THERE IS A SETXXX MACRO. IT IS INITIALIZED TO ZERO UPON ANY RELEASE UUO, AND IS USED TO REMEMBER WHICH ENTRIES HAVE BEEN SET (BY SETXXX OR FORSET OR INSURE) SINCE THE RELEASE. CHNARG IS USED BY THE INSURE MACRO TO DETERMINE WHICH ENTRIES MUST BE SET FROM THE JOB STANDARD DATA BASE.

LOCATION CHNCRB ALWAYS CONTAINS THE "CURRENT RELATIVE BLOCK" NUMBER WHICH FILTST EXPECTS TO READ OR WRITE NEXT. IT IS SET UP BY ANY XCTSTI ON XCTSTO MACRO, BUT MORE IMPORTANTLY, IT IS INCREMENTED ON EVERY INPUT OR OUTPUT UUO DONE BY FILTST. ITS CONTENTS ARE WRITTEN INTO ANY OUTPUT BLOCK AND CHECKED UPON READING ANY INPUT BLOCK. THAT IS, AMONG OTHER THINGS EVERY BLOCK OF ANY FILE CREATED BY FILTST CONTAINS ITS OWN RELATIVE BLOCK NUMBER. IF THE ERROR MESSAGE "INCORRECT RELATIVE BLOCK NUMBER IN INPUT DATA" APPEARS, THE USER CAN FIND THE EXPECTED NUMBER IN CHNCRB AND THE ACTUAL NUMBER IN THE CURRENT INPUT BUFFER (AS THE IMPURE DATA BASE DEFINITION IN FILTST LISTING WOULD REVEAL. LOCATION IBHBLK IN THE CHANNEL DATA BASE - FOUND THRU ACCUMULATOR D - IS THE INPUT BUFFER HEADER POINTER; THE RELATIVE BLOCK NUMBER IS THE FIRST DATA WORD IN ANY BUFFER AS THE TABLE AT LOCATION ITMLST WOULD REVEAL).

NOTE THAT ALL OF THE ABOVE SYMBOLIC LOCATIONS ARE RELATIVE TO THE CURRENT CHANNEL DATA BASE. USING DDT, ONE FINDS THE CURRENT DATA BASE BY TYPING D/ AND THEN PERHAPS \$Q<DB: SUCH THAT FROM THEN ON ONE CAN TYPE DB+CHNCRB/ ETC.

5. FEATURES YET TO BE IMPLEMENTED

A NUMBER OF FEATURES PLANNED FOR FILTST ARE NOT IMPLEMENTED AS OF THIS WRITING. THEIR ABSENCE DOES NOT PRECLUDE THE USE OF FILTST AS AN EFFECTIVE TEST VEHICLE IN ITS PRESENT STATE; HOWEVER, SINCE THE STRUCTURE OF THE PRESENT VERSION IN SOME WAYS REFLECTS THE ANTICIPATED INCLUSION OF THESE FEATURES IT IS WELL FOR ANYONE WHO MIGHT MODIFY THE PRESENT VERSION TO HAVE CONSIDERED THE FOLLOWING POINTS:

1. MULTI-JOB FEATURES: SOME COORDINATED TESTS CAN BE PERFORMED ONLY WITH TWO (OR MORE) JOBS ACTING IN A SYNCHRONOUS FASHION ON THE SAME FILES. IT IS PLANNED THAT FILTST INCLUDE AN OPTION TO ESTABLISH ONE (OR MORE) ADDITIONAL JOBS THROUGH THE PSEUDO-TELETYPE TO SYNCHRONIZE THE ACTIVITY OF THIS SLAVE JOB WITH THE MAIN JOB.

A SIMPLE MECHANISM TO ACCOMPLISH THIS SYNCHRONIZATION MIGHT INVOLVE TWO SEPARATE TESTS TABLES, ONE TO DRIVE EACH OF THE JOBS, WITH ALL PROCEDURES BEING SHARED AS USUAL. A SINGLE MACRO MIGHT BE DEFINED FOR INCLUSION IN EITHER TESTS TABLES WHICH SAYS IN EFFECT: "PUT THIS JOB INTO IDLE (SLEEP LOOP) AND START THE OTHER JOB AGAIN". THE TWO JOBS WOULD NOT RUN IN PARALLEL, BUT RATHER IN SEE-SAW FASHION TO ACCOMPLISH SYNCHRONIZED ACTIONS. (THE EFFECT OF MULTIPLE COPIES OF FILTST RUNNING TO CREATE AN INTERESTINGLY HEAVY LOAD IS EASILY ACHIEVED WITH THE PRESENT VERSION OF FILTST BY RUNNING MULTIPLE JOBS, SHOWING THE HIGH SEGMENT, AND STARTING EACH WITH A DIFFERENT INITIAL OFFSET INTO THE TESTS TABLE.)

THE MAJOR REASON WHY MULTI-JOB FEATURES HAVE NOT YET BEEN IMPLEMENTED IS THE TIME REQUIRED TO DESIGN AND IMPLEMENT THE CODE WHICH DEALS WITH THE PSEUDO-TELETYPE AND WHICH HANDLES THE PRINTING OF ERROR MESSAGES (AND THE SUBSEQUENT COMMAND INPUT) FOR THE JOB(S) BEING CONTROLLED BY THE PTY(S).

2. CURRENTLY THE TWO MACROS XCTSRC (SEARCH UUO) AND XCTSEK (SEEK UUO) ARE NOT CODED. THEY PRESENT NO DIFFICULTY BUT WERE NOT USEFUL IN DEBUGGING FILTST UNDER LEVEL C DISK SOFTWARE.

(5, CONT'D)

3. THERE SHOULD BE A PRIVILEGED UUD IMPLEMENTED IN THE MONITOR WHEREBY A PRIVILEGED JOB COULD CHANGE THE PROJECT PROGRAMMER NUMBERS IT WAS "LOGGED IN UNDER". THEN A FILTST MACRO SHOULD BE DEFINED TO EXECUTE THIS UUD (E.G., CNGPPN PJ, PG) SO THAT FILTST PROCEDURES COULD BE WRITTEN TO TEST THE VARIOUS FILE PROTECTION FEATURES OF THE MONITOR.
4. AS PART OF ITS INITIALIZATION, FILTST COULD, AND PROBABLY SHOULD, CREATE UFDS FOR ALL OF THE ENTRIES IN DIR,XX TABLE IN EACH OF THE STRUCTURES IN THE STR,XX TABLE, IF SUCH UFDS DID NOT ALREADY EXIST. THIS ACTION WOULD REQUIRE THAT FILTST BE ABLE TO TEMPORARILY ASSUME MASTER FILE PRIVILEGES AS IT COULD DO WITH THE CNGPPN MACRO IN 3 ABOVE.
5. RATHER THAN ASSEMBLING INTO FILTST THE VARIOUS OPTIONS AVAILABLE TO TEST PROCEDURES FOR THOSE DATA BASE ARGUMENTS OF MORE THAN 18 BITS, THESE TABLES (XXX,YY) COULD BE SET CONVERSATIONALLY BY MEANS OF AN INITIALIZATION DIALOGUE.
6. FINALLY, NO REASON HAS BEEN FOUND SO FAR FOR FILTST TO DO ANY OF THE FOLLOWING; IT SEEMS HOWEVER, THAT THE FACT THAT FILTST DOES NOT FIND ANY REASON TO DO THESE THINGS SHOULD BE MENTIONED.
 - A. USE THE UUD WHICH ALLOWS SETTING AND/OR INTERROGATING A JOBS FILE SEARCHLIST.
 - B. USE THE UUDS WHICH ALLOW INTERROGATING WHICH FILESTRUCTURES EXIST OR OBTAINING THEIR CHARACTERISTICS.
 - C. ATTEMPT TO REMEMBER THE STATES (CONTENTS) OF THE VARIOUS UFDS IN THE DIR,XX TABLE.
 - D. ALLOW ANY ABILITY TO INTRODUCE RANDOMNEOS INTO TEST PROCEDURES.

6. APPENDIX I FILTST MACROS AND THEIR ARGUMENTS

MACRO ARGUMENTS SHOWN BELOW ARE TO BE INTERPRETED
AS FOLLOWS:

- N - ANY DECIMAL INTEGER
- A - ONE OR TWO CHARACTERS CORRESPONDING TO THOSE
 CHARACTERS FOLLOWING THE PERIOD IN A TABLE LOCATION
 OF THE FORM XXX,XX WITHIN FILTST
- O - ANY OCTAL INTEGER
- M - ANY ONE OF THE SYMBOLS BI, BO, BB OR DM
- IST - A STRING OF THREE CHARACTER MNEMONICS (FOUND
 WITHIN THE ARGS MACRO IN FILTST) SEPARATED BY COMMAS
 AND ENCLOSED IN ANGLE BRACKETS
- R - ONE OF THE CHARACTERS N, E, X OR ANY DECIMAL
 INTEGER
- S - A STRING OF FIVE CHARACTERS FROM THE SET X,
 Ø OR 1
- L - ANY SINGLE CHARACTER OR ANY TWO CHARACTERS
- . - A PERIOD AS PART OF ANY ARGUMENT INDICATES THAT THE
 ARGUMENT MAY BE MISSING, THE ABSENCE OF A PERIOD
 INDICATES THAT THE ARGUMENT MUST BE PRESENT
- * - AN ASTERISK FOLLOWING A MACRO INDICATES THAT THE
 MACRO IS CHANNEL INDEPENDENT, THE ABSENCE OF AN
 ASTERISK INDICATES THAT THE MACRO PERTAINS TO
 THE CHANNEL DECLARED BY THE MOST RECENTLY EXECUTED
 SELCHN MACRO

A. SELECTING A CHANNEL

SELCHN N *

B. SETTING CHANNEL DATA BASE (NOTE: FOR EVERY SETXXX
MACRO BELOW, THERE IS A CORRESPONDING SELXXX MACRO
WITH IDENTICAL FORMAT ARGUMENTS FOR MODIFYING THE
JOB STANDARD, CHANNEL INDEPENDENT DATA BASE,)

SETMOD	M	-	DATA MODE
SETSTR	A	-	FILE STRUCTURE
SETARG	N	-	NO. OF EXTENDED LKP-ENT-REN ARGUMENTS
SETDIR	A	-	DIRECTORY (PJ, PG)
SETNAM	A	-	FILE NAME
SETEXT	A	-	FILE EXTENSION
SETPRT	O	-	FILE PROTECTION
SETEST	N	-	ESTIMATED LENGTH
SETALC	N	-	HIGHEST BLOCK TO ALLOCATE
SETPOS	N	-	WHERE TO ALLOCATE
SETVER	N	-	VERSION NUMBER
SETREP	N	-	REPEAT COUNT FOR RPCALL
SETNRB	N	-	NEXT RELATIVE BLOCK FOR RED & WRTSPC
SETXFW	N	-	WORDS TO TRANSFER FOR ALL RED & WRT
SETPAT	N	-	DATA PATTERN FOR ALL RED & WRT
RSTEXT		-	CLEAR RIBEXT RH
RSTPRT		-	CLEAR RIBPRT BITS 9 - 35
CLRVAL	N	-	CLEAR DATA BASE, START AT WORD N
FORSET	1ST	-	FORCE SETTING FROM STANDARD DATA BASE
INSURE	1ST	-	SET FROM STANDARD DATA BASE IF NOT ALREADY SET

C. DECLARING EXPECTATIONS

EXPECT R,,S,

D. EXECUTING UUO'S

XCTOPN	OPEN
XCTLKP	LOOKUP
XCTENT	ENTER
XCTREN	RENAME
XCTSTO N	USETO
XCTSTI N	USETI
XCTCLS N,	CLOSE
XCTRLS	RELEASE
REDNXT N,,N,)	WORDS, PATTERN
WRTNXT N,,N,)	
REDSPC N,,N,,N,)	WORDS, BLOCK #, PATTERN
WRTSPC N,,N,,N,)	

E. DEFINING PROCEDURES

PROCD	1,1
ENDPR	
CALLPR	1,1
RPCALL	1,1,N,

F. THE TESTS TABLE

DO	1,1,N,
----	--------

7. APPENDIX II FILTST COMMANDS

CHARACTER	ACTION
SPACE	HIT DDT BREAKPOINT IMMEDIATELY
S	HIT DDT BREAKPOINT WHEN CURRENT STEP OF TEST TABLE COMPLETE
C	CONTINUE AFTER AN ERROR
W	PRINT CURRENT TRACE STACK WITHOUT STOPPING
A	ABBREVIATE ERROR MESSAGES TO ERROR NUMBER ONLY
L	TYPE COMPLETE ERROR MESSAGES

SCRIPT EXTERNAL DOCUMENTATION
100-XXX-XXX-00
TONY LAUCK
2 MAY 70

THE INFORMATION IN THIS MEMORANDUM IS SUBJECT TO
CHANGE WITHOUT NOTICE AND SHOULD NOT BE CONSTRUED
AS A COMMITMENT BY DIGITAL EQUIPMENT CORPORATION,

THE PROGRAM DESCRIBED IN THIS MEMORANDUM WAS
DEVELOPED TO AID THE STUDY OF THE POP-10 MONITOR,
IT IS NOT A SUPPORTED PRODUCT, BUT IS AVAILABLE TO
CUSTOMERS ON A FOR INFORMATION PURPOSES ONLY
BASIS.

1.0 PURPOSE

THE SCRIPT PROGRAM ALLOWS PREDETERMINED SEQUENCES OF CHARACTERS TO BE SENT OVER MULTIPLE PSEUDO-TELETYPES AND THEREBY ALLOW THE SIMULATION OF A LOAD ON THE TIME-SHARING SYSTEM. THE RESULTS OF A RUN CAN BE WATCHED ON-LINE AND STATISTICS OF RESPONSE TIME, ETC, CAN BE RECORDED ON THE SYSTEM DISK.

2.0 JOB CAPABILITY

THE SCRIPT PROGRAM HAS BEEN WRITTEN AS A REENTRANT PROGRAM. THE CODE AND TEXT TO BE SENT ARE IN THE HIGH SEGMENT AND CAN BE SHARED BY SEVERAL JOBS, EACH WITH A 1K LOW SEGMENT. EACH JOB CAN CONTROL UP TO 14 JOBS, SO IT BECOMES POSSIBLE TO SIMULATE A LARGE NUMBER OF PDP-10 TIME-SHARING USERS.

3.0 CONTROL FEATURES

THE SCRIPT IS LOADED INTO THE HIGH SEGMENT FROM ANY PDP-10 INPUT DEVICE. IN ADDITION TO THE TEXT TO BE SENT, CONTROL COMMANDS CAN BE INCLUDED TO DETERMINE THE SPEED AT WHICH THE SIMULATED USERS WILL OPERATE.

3.1 TIMING PARAMETERS

PARAMETERS SUBJECT TO VARIATION INCLUDE TYPE-IN TIME, TYPE-OUT TIME, AND USER "THINK" TIME. THE TYPE-IN AND TYPE-OUT TIME CAN BE SPECIFIED AS A CONSTANT OR AS A RATE, IN WHICH CASE THE TIME WOULD DEPEND ON THE NUMBER OF CHARACTERS SENT OR RECEIVED. THE "THINK" TIME IS BROKEN UP INTO TWO PARTS: 1) THE ALLOWED RESPONSE TIME, AND 2) "FREE" TIME. IF THE COMPUTER GIVES INSTANTANEOUS RESPONSE TO A COMMAND, THE TOTAL DELAY IS SIMPLY THE SUM OF THE TWO QUANTITIES. IF RESPONSE IS GREATER THAN ALLOWED, "THINK" TIME IS EQUAL TO THE "FREE" TIME. IN BETWEEN, "THINK" TIME IS THE SUM OF ALLOWED RESPONSE PLUS "FREE" TIME MINUS THE ACTUAL COMPUTER RESPONSE TO THE COMMAND. ONE ADDITIONAL TIME FACTOR ALLOWED IS THE ABILITY TO SET A MAXIMUM RESPONSE PLUS TYPE-OUT DELAY FOR A GIVEN COMMAND. IF THE COMMAND EXCEEDS THIS LIMIT, THEN THE JOB IS INTERRUPTED BY SENDING TWO CONTROL-C CHARACTERS OVER THE PSEUDO TELETYPE. THIS ALLOWS A SCRIPT TO INCLUDE PROGRAM LOOPS WHICH ARE INTERRUPTED AFTER A SPECIFIED TIME INTERVAL.

3.2 REPETITION OF SCRIPTS

AN ADDITIONAL SCRIPT LANGUAGE FEATURE ALLOWS THE SCRIPT TO SPECIFY HOW MANY TIMES IT WILL BE EXECUTED, SO THAT STEADY STATE LOADING CONDITIONS CAN BE MEASURED.

3.3 STAGGERING LOAD BUILDUP

WHEN MULTIPLE JOBS ARE TO FOLLOW THE SCRIPT, THE SCRIPT MAY SPECIFY A STAGGERING INTERVAL SO THAT LOAD BUILDUP CAN BE GRADUAL.

3.4 MULTIPLE USER NUMBERS

AS AN OPTIONAL FEATURE, THE SCRIPT PROGRAM WILL CONVERT THE "#" CHARACTER INTO AN OCTAL STRING EQUAL TO THE PTY UNIT NUMBER. THIS WILL ALLOW ONE SCRIPT TO LOG MANY JOBS IN UNDER DIFFERENT NUMBERS OR FOR MULTIPLE JOBS TO USE SEPERATE FILES.

4.0 LOGGING OF RESULTS

THE SCRIPT PROGRAM MAKES AN ENTRY IN THE LOG FILE FOR EACH LINE OF PTY DATA SENT TO THE TIME-SHARING SYSTEM. THE TIME, IDENTITY OF A PARTICULAR JOB, NUMBER OF CHARACTERS SENT, NUMBER OF CHARACTERS RECEIVED, NUMBER OF BUFFERS RECEIVED, AND TOTAL RESPONSE TIME ARE ALL RECORDED. IN ADDITION, DELAYS IN SENDING OR SIMULATING TELETYPE OUTPUT DUE TO POOR SCRIPT PROGRAM RESPONSE ARE ALSO RECORDED. THIS PROVIDES SOME IDEA OF HOW THE RESPONSE TO THE CONTROLLING JOB AFFECTED SYSTEM LOAD AND RESPONSE TIME MEASUREMENTS. IDEALLY THE CONTROLLING JOB WOULD BE REAL-TIME, E.G. HIGH PRIORITY AND LOCKED IN CORE. DELAYS TO THE SCRIPT INPUT/OUTPUT LIGHTEN THE OVERAL SYSTEM LOAD, WHILE DELAYS IN RECEIVING REQUESTS FOR MORE INPUT ARE MEASURED AS IF THE USER JOB HAD EXPERIENCED WORSE RESPONSE THAN IT ACTUALLY DID.

AS A FURTHER CHECK ON ERRORS IN RESPONSE TIME MEASUREMENTS DUE TO POOR SCRIPT PROGRAM RESPONSE, A "+" CHARACTER IS OUTPUT WHEN POOR SCRIPT PROGRAM RESPONSE MAY HAVE CAUSED THE PT WAKE FUNCTION IN THE MONITOR TO FAIL. WHEN THIS HAPPENS, THE SCRIPT PROGRAM WILL WAKE UP BASED ON ITS SLEEP INTERVAL AND NOT ON OBJECT JOB RESPONSE. NORMALLY, THE MONITOR RESETS THE SLEEP COUNT WHEN A JOB RUNNING ON A PSEUDO-TELETYPE NEEDS SERVICE. THE SCRIPT PROGRAM TESTS THE PTY FLAGS, AND IF THE PTY DOESN'T NEED SERVICE SLEEPS. IDEALLY, THIS SLEEP WILL BE TERMINATED IMMEDIATELY BY THE MONITOR. HOWEVER, SHOULD THE SCRIPT PROGRAM BE RESCHEDULED BETWEEN TESTING THE PTY AND DOING THE SLEEP, THIS CAN'T HAPPEN. IN THIS CASE, THE SCRIPT PROGRAM COULD SLEEP FOR ITS MAXIMUM INTERVAL. THIS COULD BE UP TO 5 SECONDS. UNFORTUNATELY, THERE IS NO WAY TO TELL IF THIS HAPPENED. THE "+" IS SET WHENEVER A JOB GETS RESPONSE AND THE TIME OF DAY EXCEEDED THE TIME OF DAY THE SLEEP ENTRY WOULD HAVE TERMINATED. THIS CAN OCCUR ALSO DUE TO POOR RESPONSE ONCE THE SLEEP INTERVAL HAS TERMINATED.

4.1 DEFINITION OF RESPONSE TIME

THE RESPONSE TIME MEASURED IS THE TOTAL TIME FROM OUTPUTTING ("TYPING") A LINE OVER THE PTY UNTIL THE PROGRAM REQUESTS THE NEXT LINE OR TIMES OUT TO TWO CONTROL-C CHARACTERS, LESS TIME SPENT SIMULATING TTY OUTPUT. THUS, IF ONE LINE TO THE SYSTEM PRODUCES 50 LINES OF OUTPUT, ONE RESPONSE TIME WILL BE RECORDED, WHICH IS THE TOTAL TIME THE USER WAS WAITING FOR THE COMPUTER.

4.2 OVERLAP AND ITS EFFECT ON RESPONSE TIME MEASUREMENTS

THERE IS ONE POSSIBLE DIFFICULTY: OVERLAP BETWEEN OUTPUT AND THE NEXT INPUT. NORMALLY AN OUTPUT-BOUND PROGRAM IS WOKEN UP WHEN 8 CHARACTERS OF SPACE REMAIN IN THE MONITOR BUFFER, THUS A 0.8 SECOND DELAY (AT 10 CHARACTERS/SEC) WOULD NOT CAUSE A PAUSE IN TYPE-OUT. UNFORTUNATELY, THE PTY TRANSFERS A LINE AT A TIME, SO THIS OVERLAPPED TIME IS LOST. THE NET EFFECT IS TO MAKE THE MEASURED RESPONSE TIMES LOOK A LITTLE WORSE THAN RESPONSE TIMES AN ACTUAL TTY USER WOULD SEE. INCIDENTALLY, SHOULD THE PROGRAM REQUEST INPUT WHILE TYPEOUT IS IN PROGRESS, ALL TYPEOUT DELAY WILL BE COMPLETED BEFORE ACTING ON THE INPUT REQUEST.

4.3 DIFFERENT BUFFERING MODES

IF THE SCRIPT SPECIFIED OUTPUT AS A FUNCTION OF TIME, THEN THE SCRIPT PROGRAM WAITS UNTIL THE DELAY IS UP, THEN DATA IS TRANSFERRED OVER THE PTY TO THE SCRIPT PROGRAM. WHEN THE SCRIPT SPECIFIES AN OUTPUT RATE, THE SCRIPT PROGRAM MUST FIRST READ THE DATA FROM THE PTY, DETERMINE THE DELAY, AND THEN SLEEP. SPECIFYING ONE MODE OR THE OTHER MAY BE APPROPRIATE TO PARTICULAR PROGRAMS DUE TO DIFFERENT BUFFERING MODES.

4.4 ANALYSIS OF RESPONSE TIME RESULTS

IN ANY EVENT, THE USER MUST ANALYZE RESPONSE-TIME RESULTS WITH A KNOWLEDGE OF THESE FACTORS, AND AN UNDERSTANDING OF THE OVERLAP BETWEEN USER PROGRAM BUFFERS, MONITOR BUFFERS, AND SCRIPT BUFFERS. ALTERNATELY, IF PSYCHOLOGICAL SYSTEM PERFORMANCE IS IMPORTANT, THE USER CAN USE THE SYSTEM MANUALLY AND SEE HOW CLEVERLY THE SYSTEM IS CONCEALING ITS RESPONSE. THE MAIN PURPOSE OF THE SCRIPT PROGRAM IS TO OBTAIN CONSISTENT RELATIVE RESPONSE FIGURES TO ASSESS THE EFFECT OF HARDWARE AND SOFTWARE CHANGES IN THE TIME-SHARING SYSTEM.

5.0 FORMAT OF SCRIPT FILES

5.1 COMMAND LINES

A SCRIPT FILE CONSISTS OF SCRIPT LINES WHICH END WITH A <LINE FEED> CHARACTER. SCRIPT LINES ARE EITHER COMMAND LINES OR TEXT LINES. COMMAND LINES ARE USED TO CONTROL TYPING AND OPERATION OF THE SCRIPT PROGRAM. TEXT LINES ARE SENT OVER THE PSEUDO TELETYPE TO RUN THE OBJECT JOBS.

5.2 TEXT LINES

A COMMAND LINE BEGINS WITH ONE EXCLAMATION POINT WHICH IS FOLLOWED BY A NON-EXCLAMATION POINT CHARACTER.

A TEXT LINE BEGINS WITH NO EXCLAMATION POINT, OR WITH TWO EXCLAMATION POINTS. IN THIS CASE, ONLY THE SECOND IS SENT TO THE OBJECT JOB. IF A SCRIPT LINE BEGINS WITH ONE UP-ARROW, THEN THE UP-ARROW IS NOT SENT; INSTEAD THE NEXT CHARACTER IS CONVERTED TO A CONTROL CHARACTER BY COMPLEMENTING BIT 100. TWO UP-ARROWS RESULT IN ONE UP-ARROW BEING SENT. (THE CR/LF AT THE END OF ANY LINE STARTING WITH A SINGLE UP-ARROW ARE NOT SENT.)

NOTE THAT "!" AND "!" HAVE NO SIGNIFICANCE EXCEPT AT THE BEGINNING OF A TEXT OR COMMAND LINE.

5.3 COMMAND LINE SYNTAX

COMMAND LINES CONSIST OF NUMBERS AND LETTER SWITCHES. SWITCHES THAT TAKE NUMERICAL VALUES MAY BE PRECEDED BY A NUMBER. A NUMBER CONSISTS OF POSSIBLY ONE MINUS SIGN FOLLOWED BY A STRING OF DECIMAL DIGITS. THERE CAN BE NO SPACES OR TABS BETWEEN THE START AND END OF A NUMBER. AT OTHER POINTS, SPACES AND TABS ARE IGNORED IN COMMAND LINES.

SHOULD A NUMBER NOT BE SPECIFIED, THE LAST NUMBER SUPPLIED IS ASSUMED. IF NO VALUE HAS BEEN SUPPLIED, A ZERO IS ASSUMED AT THE START OF EACH COMMAND LINE.

CERTAIN LETTER SWITCHES MAY NOT HAVE NUMBERS ASSOCIATED WITH THEM. THESE SWITCHES MAY NOT BE PRECEDED BY A NUMBER UNLESS THERE IS AN INTERVENING LETTER SWITCH THAT ALLOWS A NUMBER.

ILLEGAL CHARACTERS OR BAD SYNTAX RESULT IN AN ERROR WHEN PROCESSING JOBS. THESE ERRORS ARE NOT DETECTED WHEN THE SCRIPT IS LOADED INTO THE HIGH SEGMENT.

A COMMAND LINE MAY INCLUDE A COMMENT BY USING A SEMICOLON.
THE SEMICOLON AND ANY CHARACTERS REMAINING ON THE COMMAND
LINE ARE DELETED WHEN THE SCRIPT IS LOADED AND SO USE NO
CORE AT RUN-TIME.

A COMMAND LINE MUST NOT END WITH A NUMBER, THUS A LETTER
SWITCH MUST FOLLOW ANY NUMBER IN A COMMAND LINE.

5.4 LETTER SWITCHES

I IF NON-NEGATIVE ARGUMENT SUPPLIED -- SETS TYPE-IN
DELAY
IF
NEGATIVE ARGUMENT SUPPLIED -- SETS TYPE-IN
RATE.

O SAME AS I EXCEPT THAT IT SETS TYPE-OUT RATE.

R IF NON-NEGATIVE ARGUMENT SUPPLIED -- SETS ALLOWED
RESPONSE TIME

F IF NON-NEGATIVE ARGUMENT SUPPLIED -- SETS FREE TIME

S IF NON-NEGATIVE ARGUMENT SUPPLIED -- SETS STAGGER TIME

T IF POSITIVE ARGUMENT SUPPLIED -- SETS NUMBER OF
TIMES TO DO SCRIPT.

C IF A POSITIVE ARGUMENT SUPPLIED -- SETS MAXIMUM
DELAY BEFORE PROGRAM SENDS +C+C
IF
ZERO ARGUMENT SUPPLIED -- INHIBITS SENDING
+C+C TIME-OUT

L NO ARGUMENTS ALLOWED -- SETS L MODE FLAG

N NO ARGUMENTS ALLOWED -- CLEARS L MODE
FLAG

U NO ARGUMENTS ALLOWED -- SETS U MODE FLAG

V NO ARGUMENTS ALLOWED -- CLEARS U MODE
FLAG

5.5 TIMING UNITS

TIMES ARE IN MILLISECONDS. RATES ARE IN MILLISECONDS PER
CHARACTER.

5,6 L MODE

WHEN L MODE IS SET <CR> AND <LF> WILL NOT BE SENT OVER THE PTY, THUS A LINE ENDING WITH <ALTMODE> CAN BE SENT, ANY LINE MUST END HOWEVER WITH A FULL CHARACTER SET BREAK CHARACTER DUE TO A LIMITATION IN THE PTY.

5,7 U MODE.

WHEN SET U MODE CONVERTS "*" IN TEXT LINES INTO A STRING OF TWO OCTAL DIGITS EQUAL TO THE PTY UNIT NUMBER, (LEADING ZEROS WILL BE INCLUDED.) ALL DEC SCRIPTS USE THIS FEATURE TO LOG IN THE JOB UNDER PPN 4,77700 THROUGH 4,77777 (I.E., 4,777#).

6.0 OPERATING INSTRUCTIONS

6.1

BUILD A TIME-SHARING SYSTEM WITH SUFFICIENT JOBS AND PSEUDO-TELETYPES. ONE CONTROL JOB WILL BE NEEDED FOR EACH 14 JOBS FOLLOWING THE SCRIPT.

6.2

CREATE AN APPROPRIATE SCRIPT.

6.3

START THE SCRIPT PROGRAM.

6.4

WHEN IT ASKS IF A SCRIPT IS TO BE LOADED, TYPE "YES <CR>".

6.5

TYPE THE DEVICE, FILE NAME, AND EXTENSION. IF ARGUMENTS ARE NOT SUPPLIED, THEY DEFAULT TO DSK:SCRIPT.

6.6

THE PROGRAM WILL RESPOND WITH "LOADED!". IF THERE WERE ERRORS IT WILL ASK INSTEAD IF A SCRIPT IS TO BE LOADED, GO BACK TO STEP 6.4.

6.7

IF THE SCRIPT IS NOT GOING TO BE SHARED GO TO STEP 6.10.

6.8

RETURN TO MONITOR MODE AND SAVE THE LOADED SCRIPT WITH A SSAVE COMMAND. EXAMPLE: "SSAVE DSK SCRIPT <CR>".

6.9

START N COPIES OF THE PROGRAM BY LOGGING IN N JOBS AND GIVING THE COMMAND "RUN DSK SCRIPT" OR WHAT EVER IS NEEDED TO LOAD THE SAVED VERSION FROM STEP 6.8. EACH JOB WILL ASK IF A SCRIPT IS TO BE LOADED, ANSWER "NO<CR>". THE INSTRUCTIONS IN THE REMAINING STEPS SHOULD BE FOLLOWED FOR EACH OF THE N JOBS.

6.10

THE PROGRAM WILL NOW ASK HOW MANY JOBS ARE TO BE RUN. ENTER THE NUMBER FOR EACH CONTROL JOB ON ITS TTY. THE MAXIMUM NUMBER IS 14 JOBS PER CONTROL JOB, EACH OBJECT JOB NEEDS A PTY.

6.11

THE PTY NAMES WILL BE TYPED OUT AS THEY ARE INITED BY EACH SCRIPT JOB. SHOULD THERE BE TOO FEW, THEN THE SCRIPT PROGRAM WILL RELEASE ALL GOTTEN SO FAR AND ASK OVER AGAIN HOW MANY JOBS ARE TO BE RUN.

6.12

THE FIRST JOB RUN BY A GIVEN SCRIPT JOB CAN BE MONITORED ON DEVICE TTY. THIS IS USEFUL FOR DEBUGGING A NEW SCRIPT. ANSWER THE QUESTION "DO YOU WANT TO WATCH FIRST JOB ON TTY?" APPROPRIATELY. INCIDENTALLY, IF DEVICE TTY HAS BEEN ASSIGNED TO A DIRECTORY DEVICE, THIS OUTPUT WILL BE GIVEN THE FILE NAME "MONITR". SHOULD THE DEVICE BE UNAVAILABLE, OR THE FILE UNENTERABLE, AN ERROR MESSAGE WILL APPEAR ON THE TELETYPE AND THE QUESTION WILL BE ASKED AGAIN.

SHOULD AN ERROR OCCUR ON DEVICE TTY WHILE RUNNING, THE RUN WILL NOT BE SUSPENDED. HOWEVER, SUBSEQUENT MONITORING WILL BE INHIBITED.

6.13

IF THE SCRIPT CALLS FOR FASTER OUTPUT THAN DEVICE TTY CAN HANDLE, THEN THE SCRIPT JOB WILL GO INTO I/O WAIT. THIS WILL RESULT IN VERY LONG DELAY TIMES ATTRIBUTED TO THE SCRIPT PROGRAM. THIS CONDITION SHOULD BE AVOIDED BY CHANGING THE SCRIPT PARAMETERS, USING A FASTER DEVICE TTY OR NOT MONITORING AT ALL.

6.14

THE PROGRAM WILL NOW ASK, "DO YOU WANT RESPONSE TIMES LOGGED?" A "NO<CR>" ANSWER WILL CAUSE THE SCRIPT TO BEGIN. IN THIS CASE, GO TO STEP 6.16.

6.15

IF THE QUESTION WAS ANSWERED "YES<CR>", THE PROGRAM WILL ASKED FOR A DEVICE, FILE NAME AND EXTENSION. ARGUMENTS NOT SUPPLIED WILL DEFAULT TO DSK:LOGFIL.

IF THE DEVICE IS NOT AVAILABLE, OR IF THE FILE CAN NOT BE ENTERED, GO BACK TO STEP 6.14.

SHOULD A DATA ERROR OCCUR WHILE RUNNING, THE RUN WILL PROCEED WITH SUBSEQUENT LOGGING INHIBITED. AN ERROR MESSAGE WILL APPEAR ON THE TELETYPE.

6.16

JOBS UNDER CONTROL OF A GIVEN CONTROL PROGRAM WILL BE STAGGERED BY AN INTERVAL SPECIFIED IN THE SCRIPT. IF MULTIPLE SCRIPT JOBS ARE RUNNING, THE USER CAN STAGGER THEIR TIMING BY ENDING STEP 6.14 OR 6.15 AT THE APPROPRIATE TIME OF DAY.

6.17

WHEN THE LAST JOB UNDER A GIVEN SCRIPT PROGRAM HAS FINISHED, THE MESSAGE "ALL JOBS DONE!" WILL APPEAR ON THE USERS TELETYPE AND THE LOG FILE AND MONITOR FILE WILL BE CLOSED, THE PROGRAM WILL THEN EXIT.

NOTE THAT IF MULTIPLE JOBS ARE RUNNING THE FIRST JOB MAY WELL BE OVER A LONG TIME BEFORE THE LAST. THIS IS THE JOB MONITORED ON DEVICE TTY.

6.18

SHOULD IT BE NECESSARY TO TERMINATE A RUN, STOP THE CONTROL PROGRAM BY TYPING TWO <CONTROL C> CHARACTERS, TO CLOSE OUT THE LOG FILE REENTER THE PROGRAM BY A REENTER COMMAND. A MESSAGE "JOBS ABORTED!" WILL APPEAR ON THE TELETYPE.

IN CASE THIS IS DONE, BE AWARE THAT ANY JOBS RUNNING UNDER SCRIPT PROGRAM CONTROL WILL NOW BE DETACHED. THE USER SHOULD KILL THESE JOBS OFF OR DO A 143 MONITOR RESTART TO FLUSH ALL JOBS.

6.19

THE FORTRAN PROGRAM TOTAL CAN BE USED TO SUMMARIZE THE RESPONSE LOG FILE. IT TAKES INPUT FROM 1:FOR01.DAT AND PLACES A SHORT LISTING ON 6:FOR06.DAT.

DMPFIL IS A FILE DUMP PROGRAM; IT READS A FILE AND PREPARES A PRINTABLE VERSION OF AN OCTAL DUMP OF THE FILE. IT WILL ALSO DUMP A DECTAPE BLOCK BY BLOCK, OR DUMP A SAVE FILE AS A CORE DUMP, OR A DISK FILE STRUCTURE BLOCK BY BLOCK.

ASSEMBLY INSTRUCTIONS:

.COMPILE DMPFIL

THERE ARE NO ASSEMBLY OPTIONS

RUN INSTRUCTIONS:

.R DMPFIL
<OUTPUT FILE>-<INPUT FILE>/SWITCHES

SWITCHES:

NNNNND - DUMP DECTAPE, BEGINNING AT BLOCK NNNNNN (OCTAL)
INCLUDES LISTING OF DIRECTORY

NNNNNK - ASSUME FILE IS SAVE FILE, DUMP AS CORE DUMP, BEGINNING AT LOC NNNNNN
NNNNNH - ASSUME FILE IS HIGH SEGMENT SAVE FILE, DUMP AS CORE DUMP

NNNNNS - DUMP DISK, BEGINNING AT BLOCK NNNNNN(OCTAL), USING SUPER USET;

NNNNNT - STOP DUMP AT NNNNNN(OCTAL)

DEFAULT OUTPUT FILE IS LPT: .LST

DEFAULT INPUT FILE IS DSK;
DEFAULT IS THE SAME FILE ON BOTH SIDES
IF NO "<-", INPUT FILE IS SPECIFIED
"=" CAN BE USED FOR "<-"

REENTER WILL CLOSE THE FILES.
