ENG Paul Severino	APPD <i>[Signature]</i>	SIZE A	CODE SP	NUMBER AD01-D-12	REV
----------------------	----------------------------	-----------	------------	---------------------	-----

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE AD01-D Acceptance Procedure

1.0 Purpose: The purpose of this acceptance test is to show that the AD01-D works properly within stated specifications. The test should be run in sequence from beginning to end to prove the operation and specification.

1.1 Equipment Required - Voltage Standard (EDC or Equivalent)
Wave or Pulse Generator (Wavetek, Datapulse, or Equivalent)

2.0 Visual Inspection (Power Off)

All modules should be in the proper slots as referenced to the module utilization drawing. The back plane wiring should be examined for any gross wiring discrepancies. The unibus cable (BC-11) should be in slot AB01 with the terminator card (M930) in slot AB02 if the AD01 is the last device on the bus.

2.1 Analog Modules (A Series)

All adjustment pots on A series modules should be sealed with the exception of those which are not used in certain option combinations. This information is available in the calibration procedure.

2.2 Multiplexer

The AD01 has provision for 32 channels of multiplexing. The MUX module is the A124 and contains four (4) channels. A check should be made to determine the number of channels present is the correct number. The proper location for the

	SIZE A	CODE SP	NUMBER AD01-D-12	REV
--	-----------	------------	---------------------	-----

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE AD01-D Acceptance Procedure

A124 Modules are:

<u>Slot</u> A17	CH00 - CH03	<u>Slot</u> B17	CH16 - CH19
A18	CH04 - CH07	B18	CH20 - CH23
A19	CH08 - CH11	B19	CH24 - CH27
A20	CH12 - CH15	B20	CH28 - CH31

2.0 Insure Flip-Chip module handle extenders and hold down bar in place.

3.0 Logic Testing

The logic testing is accomplished by loading the AD01D diagnostic Maindec-11-D6AB with the binary loader. The G735 test card should be inserted into slots AB21. Set the voltage standard (EDC) for 0.625V.

3.1 Running the diagnostic

3.1.1 Normal (Worst Case) Testing

The starting address is 200 and the program halts 3 times at the start.

- 1st Halt - Load initial channel number (SW0-SW5)
- 2nd Halt - Load number of channels to be tested (SW0 - SW5)
- 3rd Halt - Set SR option (if AH05 is ordered set SR 8-1 at this halt.

The continue switch should be hit after each halt. The program should now run testing all logic, control functions, gain, linearity and analog channels. If the AH05 option is installed the program will ask for the proper input voltage to test the sign. The gain linearity test may fail if external noise is excessive. However, the test should be

SIZE	CODE	NUMBER	REV
A	SP	AD01-D-12	

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE AD01-D Acceptance Procedure

repeated as continued failures indicate non-linearity.

4.0 Channel Noise

This test is used primarily to locate excessively noisy channels. It should be noted here that this test is dependent on many factors, external noise generated at the voltage source, variations in power line voltages and radiated power line noises. Typeouts here do not necessarily indicate failures. When running the was-is test the main thing to watch for is excessively noisy channels. This is indicated by repeated typeouts on the same channel with 3-4 count spreads.

4.1 Running the Was-Is Test

1. Set EDC to "0" on polarity switch.
2. Load and start at SA270; the program will halt 3 times:
 - 1st Halt - Load initial channel in octal (Bits 05-00) and Gain (Bits 07-06)
 - 2nd Halt - Load number of channels (Bits 05-00)
 - 3rd Halt - Set SR option (refer to diagnostic for option settings). For acceptance purposes load SRO at this halt.

Hit continue after each halt. The test should be run for each gain using the discussion in the previous Section (4.0) as a guide. At the end of each pass (4096 conversions per channel) the teletype bell will ring. Test should run for a minimum of 5 minutes without errors.

4.2 Channel Continuity

With the Was-Is test running at a gain of 1 and the EDC set at 9:9900V. Set SW6=1. A table will print out

SIZE	CODE	NUMBER	REV
A	SP	AD01-D-12	

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE AD01-D Acceptance Procedure

giving the channel number, initial value and new value. of the converted data. With the G735 test card in use each channel will be half of the previous channel value until at the tenth(8) channel, the full voltage will then repeat. For a full scale input as set above the printout for 10(8) channel will look like the following:

Channel	Initial Value	Final Value
CH00	1777	1777
CH01	1000	1000
CH02	0400	0400
CH03	0200	0200
CH04	0100	0100
CH05	0040	0040
CH06	0020	0020
CH07	0000	0000
CH10	1777	1777

If the G735 test card is not available each input should be given a known voltage and the results checked in the display conversion loop SA220.

5.0 Repeatability Test (3 Sigma)

This routine tests repeatability to specifications on the channels desired at gains of 4 and 8. Ten thousand conversions are taken at each gain. The specifications have been interpreted to mean that 35 conversions out of the ten thousand may be outside of 2 states at a gain of 4, and that 35 conversions out of ten thousand may be outside of 3 states at a gain of 8.

SIZE	CODE	NUMBER	REV
A	SP	AD01-D-12	

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE AD01-D Acceptance Procedure

5.1 Running the 3 Sigma Test

The Pass- Fail aspect of this test is based on the specification for repeatability of the converter, and requires that the input to each channel be grounded. This can be accomplished by setting the EDC to ZERO (0) at the polarity switch or by connecting the inputs to analog ground. The SA is 300. At the first halt set the initial channel number to be tested in SW05-SW00. At the second halt set the number of consecutive channels to be tested in SW05-SW00. The test will now run, ringing the bell after each successful pass. Again it should be noted here that this test is dependent on outside factors especially radiated power line noise and variations in power line voltages. This test should be run for a minimum of 5 min, without errors.

6.0 Accuracy

The accuracy specification for the AD01-D is 0.1% of F.S. This specification can be proved by checking switching points and comparing the values obtained against the proper calibration chart. (Unipolar chart for basic unit and Bipolar if AH05 is installed). Each switching point should be within the specified tolerance on each gain.

SIZE	CODE	NUMBER	REV
A	SP	AD01-D-12	

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE AD01-D Acceptance Procedure

6.1 Running the Accuracy Test

This is accomplished by using the display loop section of the diagnostic program. The SA is 220 and the program will immediately run upon starting. Channel and gain can be selected while the program is running. The following are the switch register settings:

Channel (Octal) - SW5-SW0
Gain (Octal) - SW7-SW6

The switching points should be checked at CH00 since the G735 acts as a voltage divider. All the switching points need not be checked for acceptance as production checkout has already been through the calibration sheet. However, six to eight readings on each gain should suffice. It should be noted here that the accuracy of the voltage standard should be considered in making the measurements. For example, if an EDC is used with an accuracy of $\pm 0.01\%$ of F.S. 10V, the EDC reading is good only to ± 1 millivolt. The accuracy test is the final part of the procedure. The G735 card should be removed from slot AB21 and the M908 cards replaced in slot AB22. The hold down bar should now be installed.

7.0 External Sync Test

The wave generator should be connected to the EXT. IN in slot A21. The jumper from Pin A22R2 to A22C2 should be

SIZE	CODE	NUMBER	REV
A	SP	AD01-D-12	

ENGINEERING SPECIFICATION

CONTINUATION SHEET

TITLE AD01-D Acceptance Procedure

removed.

7.1 External Conversion Test

This routine counts external conversions and prints out after every tenth conversion. The SA is 230 and the frequency of the input trigger signal should be set at about 1 cycle (1HZ).

Switch Register Settings

SW5-1. Causes the program not to set external enable thus no printout should occur.

SW6-1. Causes it to run internal conversions during external conversions. The proper error message will occur.

SW7-1. Prevents it from clearing done after each conversion thus an error printout will occur. It should also be noted that if the external trigger frequency is too fast error printouts will occur.

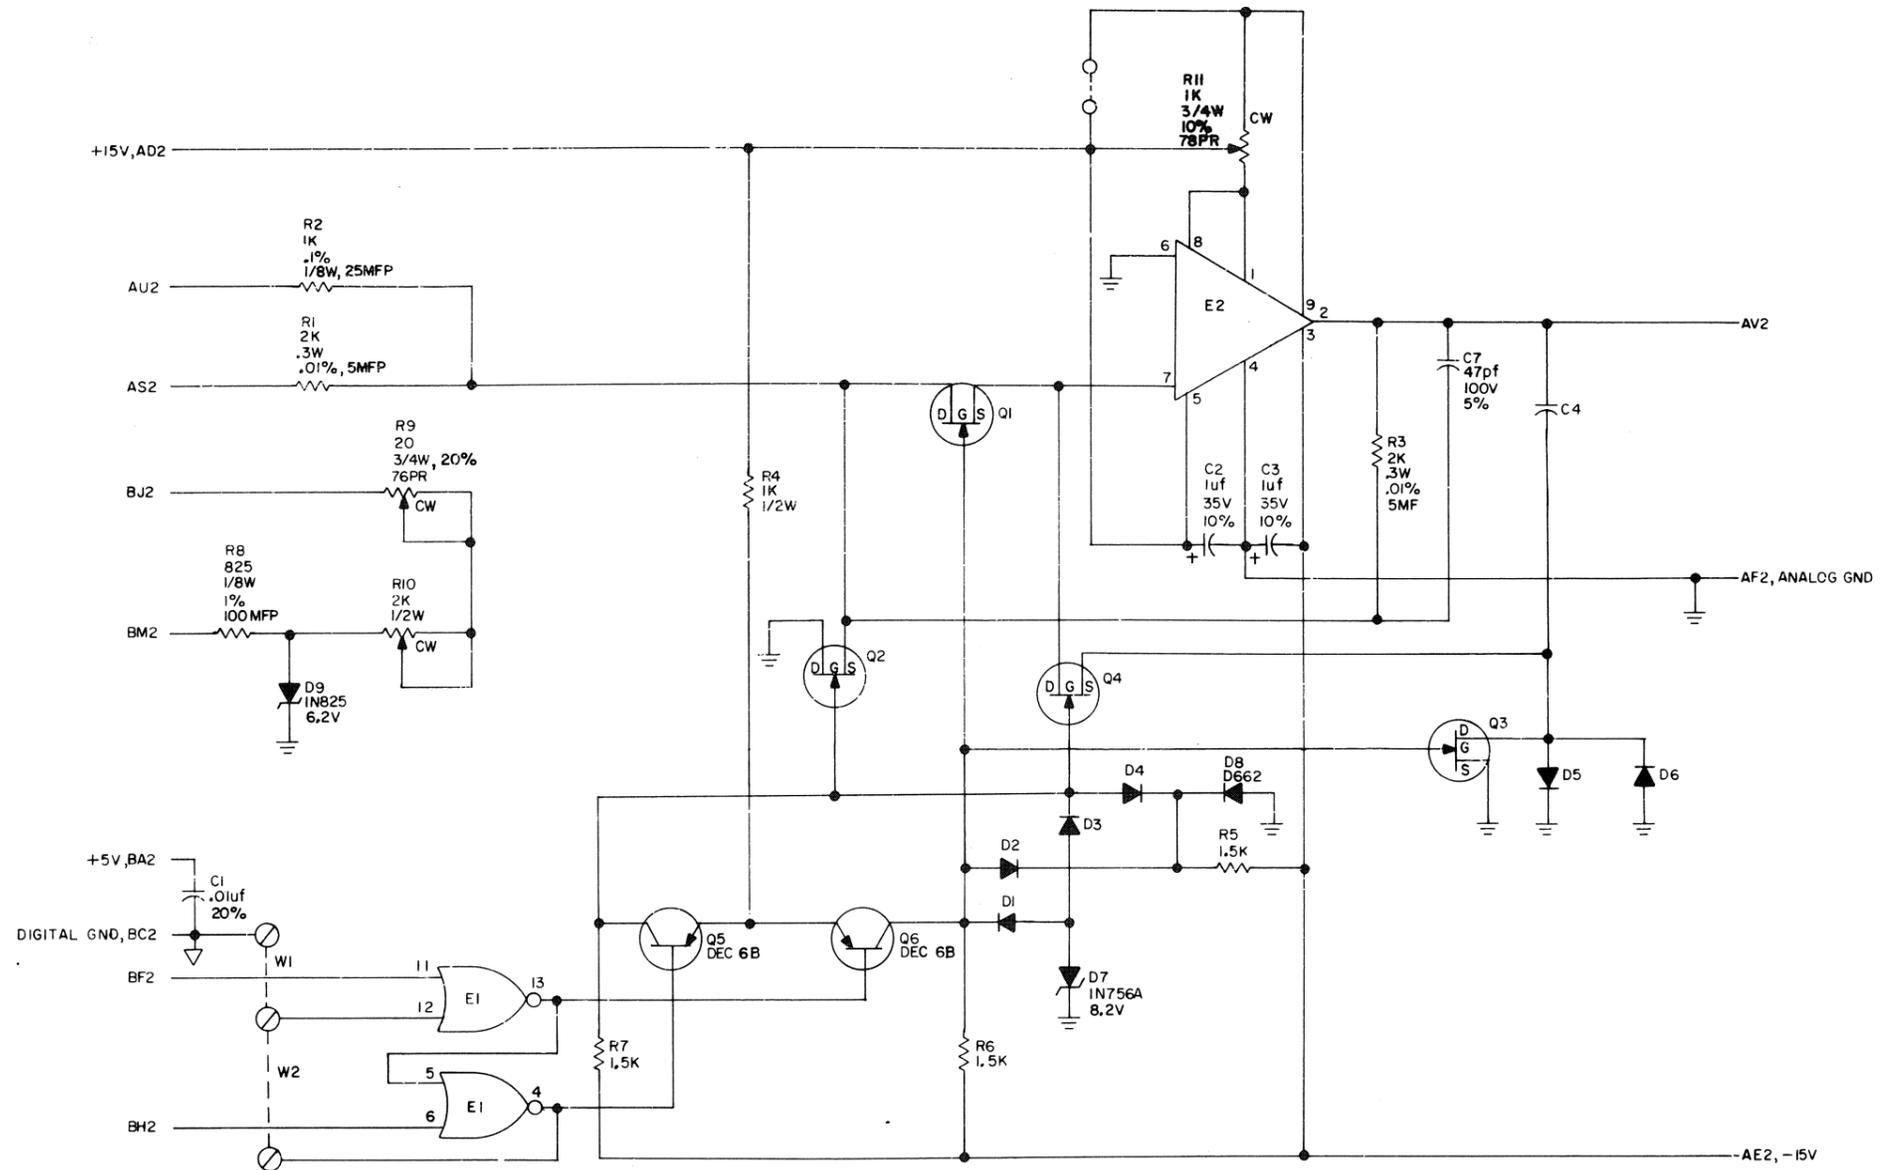

8.0 Documentation and Software

The following items should be complete and included:

1. AD01-D Print Set
2. Maintenance Manual or Engineering Specifications.
3. Key sheets, checkout log, Q.C. status, accessories as stated on accessory check list.
4. AD01-D Maindec-11-D6AB Diagnostic Program and Write-up
5. AD01-D Calibration Procedure
6. AD01-D Calibration Chart
7. ECO Status Sheet
