1.0 ABSTRACT

This formatter was written to format Winchester drives attached to the RQDX3 disk controller. All new drives being attached to the RQDX3 controller must be formatted so that the drive can be brought online for use by a MSCP server or in simpler terms to be used by an operating system. This disk formatter is similar to the RQDX1/2 disk formatter in that the same standard DUP dialog is used and similar standard formatter questions are passed by the controller to the host user. The formatter is different from the RQDX1/2 disk formatter because a table of disk formatting parameters is passed to the controller. The RQDX1/2 disk controller already has these tables in its firmware.

The format program actual has 2 controller run programs in it. If the controller is an RQDX3, the program will down line load a program into the controller which will identify the drive according to its cylinder size. Since each of the DEC drives have a differnt cylinder size it will know which drive it is and therefore which parameter or UIT table to pass to the controller. The second program is already contained in the microcode. This program called "FORMAT" does the actual formatting of the drive. The host program just passes information back and forth to the controller local program.

The UIT, Unit Information Table is picked by the down line loaded auto sizer program (AUTOSZ). After the drive is known the format program will be run on the controller. This format program (FORMAT) is very similiar to the RQDX1/2 format program. The only difference as stated before is that the UIT will be down line loaded into the drive if the down line load question is asked. Every time the drive is brought on line the UIT table which was placed on the drive by this formatter program will be transferred into the controller with all the drive parameters. As long as the UIT still exists on the drive it does not have to be passed in by the host user. Only if the user requests to "Down line load" information to the controller will the UIT table be passed to the drive. Note the RX33 floppy drive does not use the UIT tables. The RX33 drive parameters are stored in the firmware so a table wasn't necessary.

The UIT table contains information about the drive such as size, number of tracks per surface, etc. This information is already know for certain DEC acquired Winchester drives. These tables are usually different for the different drives manufactured. CAUTION - do not use non DEC drives you are liable to destroy Format and Data storeed on them.

All though not a goal of the diagnostic this program can be used to run standard DUP dialog local programs such as "DIRECT". These local programs are stored in the firmware.

174

An RQDX3 disk controller and one or more Winchester or RX33 drives configured into a Q-bus PDP-11 system.

2.2 SOFTWARE REQUIREMENTS

This diagnostic was written using DRS the Diagnostic Supervisor. The diagnostic is expected to be run under XXDP diagnostic operating system. It is also possible to run the formatter under APT.

2.3 QUESTIONS ASKED AND THEIR ANSWERS

2.3.1 HARDWARE QUESTIONS FROM DIAGNOSTIC SOFTWARE

The diagnostic is a standard DRS program with the standard DRS commands. Below I have a script of the questions asked an the answers to the initial DRS questions. The Default value for the IP address is 172150. This is standard configuration address for the first MSCP controller on a system. Any other MSCP controllers on the system will have to be in the floating address space of the IO page. The default vector address is 154 any other value between 0-774 could be used but is not suggested. If you want the default answers then just hit the "return" key on the keyboard. The Formatter will run an auto sizer to determine the proper drive characteristic table to give to the controller. This auto sizer will figure out how many cylinders on the drive and through a small look up table we decide which table to down-line load to the RQDX3 controller. The user will have to enter a drive number and a serial number. After this a warning message will appear asking if the user wants to proceed. The default is no so the/ user must type "Y" in order to format his drives.

Typical Diagnostic Script:

```
boot up XXDP
.RUN ZRQC??

2.3.2 UIT TABLES

The UIT tables are stored in this program. There are 10 large data tables formed in this diagnostic that contain the drive parameters for certain DEC drives. There are only 6 RQDX3 Winchester drive manufactures. So only 6 of the tables contain any information. The others are there for future drives. The AUTOSZ program ran previous to the FORMAT program will determine what type of drive is to be formatted and which table to pass to the disk controller. Once in the disk controller the table will be written to the disk drive. This table should never be erased unless the drive is broken or format is run again.

NOTE this is only for the RQDX3 disk controller and NOT for the RQDX1/2.

Unit Information Tables listed:

Enter UIT:

2.4 PROGRAM MESSAGES AND FORMAT COMPLETION

When the format finally starts a "Format Begun" message will appear and in the end a "Format Complete" message will appear. There may be 60+ minutes between the messages. If the extended messages are allowed 3 "Verification Pass XXXXXX Begun" messages may appear. These messages tell when the controller checks the blocks for bad spots in the disk surface. These passes take several minutes each and touch all the cylinders on the drive. At the end of the format if extended messages are on a table will be printed out reporting the results of the format. Usually there are several bad spots on a disk. This is very common and is NOT a mistake. These bad blocks are revectorized to new areas on the disk. If the manufacturer's bad block information is used which is usually the case. There will only be 1 verification pass. After the drive formats the autosizer program will be run again. This will park the heads on the inner most cylinder. Some manufacturers have a parking area where the heads are placed before the drive is physically moved or shipped to the customer. If you plan on moving your system you should backup your system and run the formatter to put the heads on the parking area. This will help prevent damage to the heads and formatted data surfaces.

Completion Report:

xxx Revectored LBNs
xxx Primary revectored LBNs

232 xxx Secondary/tertiary revectored LBNs
233 xxx Bad Blocks in the RCT area due to data errors
234 xxx Bad Blocks in the DBN area due to data errors
235 xxx Bad Blocks in the XBN area due to data errors
236 xxx Blocks retired on check pass
237 FCT was not used
238 Format Completed
239
240 RQDX Drive xxxx finished
241 PLEASE wait Parking drive heads
242
243 pass aborted for this unit
244 ZRQC EOP 1
245 0 Cumulative errors
246
247 Note that every time the disk formats successfully the program
248 drops the UNIT. This is purposely done so one doesn't reformat
249 it twice.
250
251 RX33 diskette formatting is a little varied in that several extra
252 questions will be asked. These questions were installed mainly to
253 protect the person trying to format a diskette on the same drive as
254 their boot media. If the drive doing the formatting is not the boot
255 drive then please ignore the warnings.
256
257 WARNING - Remove boot diskette if in drive.
258 Insert a diskette to be formatted & press <RETURN>.
259
260 Format Complete

266
267 If boot drive, reinsert boot diskette & press <RETURN>.
268
269 RQDX Drive xxxx finished
270 pass aborted for this unit
271 ZRQC EOP 1
272 0 Cumulative errors
273
274 2.5 EXECUTION TIME
275 The execution time for this diagnostic varies greatly according
276 to the size of the drive being formatted. If an error in the
277 drive configuration or state such as a write protect switch
278 being on, an error will occur right after all the questions have
279 been answered. If there are no errors the formatter will take
280 between 5 minutes to 60 minutes depending on the drive being formatted.
281 A RD51 takes between 10 minutes to format depending on the way
282 questions are answered. A RD52 take between 10 & 25 minutes to format
283 and a RD53 a very long time to format. The program checks continuously
284 to make sure the controller is still working. If no progress is
285 indicated by the progress indicator a timeout error will occur. If
286 the disk controller goes off line for some unapparent reason the
287 formatter will know. Either way if one checks the light on the

Winchester to see if it is lite or check the READY light of the drive for a flickering light, this will tell the user that the formatter is working. When the formatter completes a "Format complete" message will appear on the terminal.

3. ERRORS

There are many types of errors possible while formatting a drive. First the system has to be configured right. The drives have to be jumpered right along with the disk controller. If you get an error read the entire error message carefully. See if there is something simple wrong such as loss and misconfigured drives before calling FS. This is usually the case very seldom do the drive or controller break. So check the cables, check the jumpers, try several times and if you still can't format then call Field Service.

error #	Comment	Problem
0,SF0	;unkown response Not a DUP standard local program or Data Error in local program execution.	
1,HRD0	;Fatal DUP type returned Error with Format program check detailed error message more then likely this will be a drive error or drive configuration error. If the detailed message has a GET STATUS error. This means that the drive you asked to format had the wrong status. Example offline, write protected, RX50 instead of an RDxx, power plug us loose, jumpers are wrong.	
2,DF3	;Can't do remote programs" Wrong controller or bad microcode controller error.	
3,SFT0	;;"already active will do an ABORT cmd" Wrong controller or bad microcode controller error. The controller was expected to be in an idle state but was found in an active state. Try again and if still there check for ECOs and new Microcode.	
4,DF2	;wrong step bit set after interrupt Controller initialazation error. Controller is broken or at wrong address and something is in its place.	
5,DF1	;controller timeout during hard init Controller error, controller is slow or it can't interrupt the Q bus. Controller is dead.	
6,SFT1	;wrong model #,wrong controller This is not really an error. You are using the wrong formatter program to for the wrong disk controller. It still might work but no guarantees.	
7,DF4	;NXM trap at controller IP address Wrong configuration address of the controller check for wrong jumper settings.	
8,SF100	;Unexpected interrupt	

346 Something in system interrupting or late interrupt. This
347 could be the system clock or an interrupt from an I/O port.
348 If the interrupt is at address 4,10 probable a software error
349 Try again.
350
351 9,DF12 ;Fatal SA error
352 Controller crashed, check detailed error message either dead
353 controller or configuration error.
354
355 10,DF11 ;Bad response packet
356 Inappropriate command or soft controller error check
357 detail message for more info.
358
359 11,DF13 ;no progress shown after cmd timeout
360 The controller didn't indicate progress which means that it is
361 working very slow or is stuck. Leave the program running for a
362 couple minutes. If this message repeats then the drive is likely
363 broken. If you just get 1 message it is possible the controller
364 took too long to revector a block. This is probably a drive error
365 or a drive with many revector blocks.
366
367 12,DF14 ;no interrupt after get dust status command controller dead
368 The controller got lost. The program running in the controller
369 got out of sync with the host program. This could mean several
370 things. Check for a loose controller board loose cables. Try running
371 again after rebooting the system. If you still get the error check
372 the controller.

4. PROGRAM DESIGN AND FLOW

376 The program is kind of simple. There is only 1 command ring and
377 1 response ring. For every command send there is expected 1 response.
378 If the command sent times out a "Get DUST Status" command is sent to
379 check on the controllers progress. This usually happens when the actual
380 format is being done. The rest of the commands pass information
381 back and forth from the user to the controller and back without ever
382 timing out. This program is written according to UQSSP and DUP specs.
383 This specs can be acquired from NEWTON::ARCH\$FILES:. At the start of the
384 program the INIT sequence brings the controller into the higher protocol
385 state of running DUP commands. Once initialized the controller executes
386 a GET DUST STATUS command to make sure the controller is in an Idle
387 state.

388
389 If idle which it should be the program asks for a program name to run.
390 The EXECUTE LOCAL PROGRAM command is executed which should start the
391 program into the DUP dialog loop. This dialog is described in the DUP
392 spec. Here several SEND DATA and RECEIVE DATA commands are executed to
393 ask questions and supply information on the success and completion of
394 the local FORMAT program running in the RQDX3.

395
396 A pass will occur when the formatter has completed formatting
397 all the logical units.

ZRQCc0 follows the module name format described in the XXDP Programmer's Guide.

RQ--- Identifies the hardware and thus the module.

--C-- Distinguishes between two or more different diagnostics for the same generic device. The sequence A, B, C, ETC. must be used for each additional diagnostic.

---c- Specifies the module revision.

----0 Specifies the number of patches.

8.0 REVISION HISTORY

Revision B contains an autosizing routine which will size the drive instead of having the user pick the drive table. This will keep people out of the systems and lower the chances of loose cables etc. Also added a AUTO mode which allows no manual interventions. Set up the default p-table to format drive 0-3. Since floppies are always the last drive in the system this is gauranteed to format all the drive in the system and error when it gets to the floppy.

Revision C contains several changes. First RX33,RD31,RD54 support was added. The RX33 boot device questions where added. The autosizer was fixed to also size for floppies. The Autosizer errors are now reported to the host along with what drives are located on what units and there drive size or floppy type. The default question in manual mode was changed so that if an FCT (factory control table) is not present "Bad Block Information" it will not continue on. This was changed for all drives except the RD51 which doesn't have a FCT table. Also there was a small change to the autosizer which affects version C1 hardware etched RQDX3 boards specially the ones without the LUN ECO. The autosizer now run in the beginning and the end. A head parking feature was added so that RD31 and RD32 heads would be parked in the inner most cylinder upon completion of the program. The autosizer utility was updated to displays a little more information.

;***** AUTOdisplay *****
; This routine will display the results of the autosizers
; findings. It will say weather the autosizer errored or not and
; what drives it found.
;***** AUTOdis: *****
; check if Special Message
; if not then no info to print
; so just return
; check message number
; return if msg number doesn't match
; test completion status of Autosizer
; if zero no error report the findings
; if not zero then there is an error

; Autosizer Failure Code
; Print Autosizer Failure Code
; Is it a UDC never done error ?
; No, check for next code
; Yes, Tell error type
; Is it a UDC never interrupted error ?
; No, check for next code
; Yes, Tell error type
; Is it a seek error ?
; No, go reinitialize ctrl
; Yes, Tell error type
; return

; Autosizer Findings
; print Autosizer findings
; first cylinder entry
; Start with unit number zero
; Is unit Non-existent ?
; No, check for RX50
; Yes, tell it is non-existent
; ...
; Is unit an RX50 ?
; No, check for RX33
; Yes, tell it is an RX50
; ...
; Is unit an RX33 ?
; No, then it is a Winchester
; Yes, tell it is RX33
; ...
; It is a WINCHESTER
; Tell it is a Winchester with so many cylinder
